Declaration of CE

This product has passed the CE certification for environmental specifications. Test conditions for passing included the equipment being operated within an industrial enclosure. In order to protect the product from being damaged by ESD (Electrostatic Discharge) and EMI leakage, we strongly recommend the use of CE-compliant industrial enclosure products.

Federal Communications Commission (FCC) Statement

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his expense.

The user is cautioned that changes and modifications made to the equipment without approval of the manufacturer could void the user's authority to operate this equipment.

1 Introduction

Welcome to Industrial 8-port Managed Fast Ethernet Switch User Manual. Following topics are covered in this chapter:

1.1 Overview

1.2 Major Features

1.3 Package Checklist

1.1 Overview

The JetNet 4508 V2/ 4508f V2 /JetNet 4508i/JetNet 4508if series are 8-port industrial managed Fast Ethernet Switch designed with advanced Layer 2 management features and high system reliability, including MSR and MSTP network redundancy technologies, for ensuring real-time and high quality connectivity in various networking applications. The Ethernet switches includes 6 10/100Mbps plus 2 100Mbps Fast Ethernet ports in RJ-45 connectors (JetNet 4508 V2, JetNet 4508i) or 6 10/100Mbps Fast Ethernet ports plus 2 100Mbps Fast Ethernet Fiber ports (JetNet 4508f v2, JetNet 4508if); Both of switches adopted 32Gbps switch fabric to provide real time non-blocking transmission performance for satisfying the needs of high bandwidth data transmission requiring applications while ensuring traffic switching without data loss. Besides, the new system design includes a hardware based watchdog timer for keeping the operating system live. It also provides power redundancy with wide range DC12V~36V inputs for ensuring the power continuity in the system. Combining the outstanding L2 management features along with the LLDP and the JetView Pro Intelligent NMS into the ruggedized design with IP31 enclosure and -25~70°C (regular version) and -40~75°C (-w version) wide operating temperature, JetNet 4508 and 4508i series provide highly reliable and secure data transmission under severe industrial environments.

The JetNet 4508i series are similar as JetNet 4508v2 series, but with different excellent electrical power system design and EMC protection. Except the Electrical Power System, the reset of Ethernet Switch function is same as JetNet 4508 series.

To make easy understand, this manual will use common product name except some of different functions will be descript separated

JetNet 4508: JetNet 4508v2 or JetNet 4508i

JetNet 4508f: JetNet 4508f v2 or JetNet 4508if

1.2 Major Features

The JetNet Managed Switch has the following features for both of JetNet 4508/4508f series (Heavy Ind./ Track Side model) and JetNet 4508i /if series (Substation model)

- 6 10/100TX ports with Auto MDI/MDI-X
- 2 100Base-TX (JetNet 4508), 2 100Base-FX (JetNet 4508f)
- 32Gbps Non-Blocking, 8K MAC address table
- Multiple Super Ring (recovery time <5ms), Rapid Dual Homing, Multiple Ring, and MSTP / RSTP
- IEEE 1588 Precision Time Protocol for precise time synchronization
- VLAN, Private VLAN, QinQ, GVRP, QoS, IGMP Snooping V1/V2/V3, Rate Control, Port Trunking, LACP, Online Multi-Port Mirroring
- IEEE 802.1AB LLDP and JetView Pro i²NMS for auto-topology and group management
- Supports SNMP, Multiple Language Web UI, Telnet In-Band, Serial Out-Band Management
- Supports ModBus TCP/Client function for HMI system.
- Embedded Hardware Watchdog for System Auto Rescue
- Dual DC12~36V Power Inputs with Redundancy
- Software configurable Alarm Output
- IP31 rugged aluminum case
- Operating temperature:
 - 25~70°C (JetNet 4508), -10~70°C (JetNet 4508f) and -40~75°C (JetNet 4508-w/ JetNet 4508f-w)

* If there is any specification change, please refer to the Web site or contact your sales window.

The detail spec is listed in Appendix

Note-1: those certifications are pending for special project request, please contact your sales window.

1.3 Package List

Korenix JetNet 4508 Series products are shipped with following items:

- JetNet Switch x1
- One DIN-Rail clip (attached to the switch)
- One RS-232 DB-9 to RJ-45 console cable
- Quick Installation Guide (QIG)

JetNet 4508 / JetNet 4508f

DB-9 to RJ-45
Cable

QIG

If any of the above items is missing or damaged, please contact your local sales representative.

2 Hardware Installation

This chapter includes hardware introduction, installation and configuration information. Following topics are covered in this chapter:

2.1 Hardware Introduction

- Dimension

- Panel Layout

- Bottom View

2.2 Wiring Power Inputs

2.3 Wiring Digital Input

2.4 Wiring Relay Output

2.5 Wiring Ethernet Ports

2.6 Wiring RS-232 console cable

2.7 DIN-Rail Mounting Installation

2.1 Hardware Introduction

Dimension of JetNet 4508 serieis

8-port managed Fast Ethernet Switch dimension is:

55 (W) x 149 (H) x 131.2 (D) / with DIN Rail Clip

55 (W) x 149 (H) x 120.6 (D) / without DIN Rail Clip

Dimension of JetNet 4508f series

Industrial 6-port plus 2 100Mbps Fiber managed Fast Ethernet Switch

dimension is:

55 (W) x 149 (H) x 131.2 (D) / with DIN Rail Clip

55 (W) x 149 (H) x 120.6 (D) / without DIN Rail Clip

Front Panel Layout- JetNet 4508 series

The front panel of JetNet 4508 includes 8 10/100Mbps Fast Ethernet RJ-45 ports, one RS-232 serial console in RJ-45 type connector, one reset button and several of LED indicators for the system and port diagnostic. The JetNet 4508 front panle shows as following diagram.

Front Panel Layout- JetNet 4508f series

The front panel of JetNet 4508f includes 6 10/100Mbps Fast Ethernet RJ-45 ports (port 1~6), 2 Fast Ethernet fiber ports (port 7, 8), one RS-232 serial console in RJ-45 type connector, one reset button and several of LED indicators for the system and port diagnostic. The JetNet 4508f V2 front panel shows as following diagram.

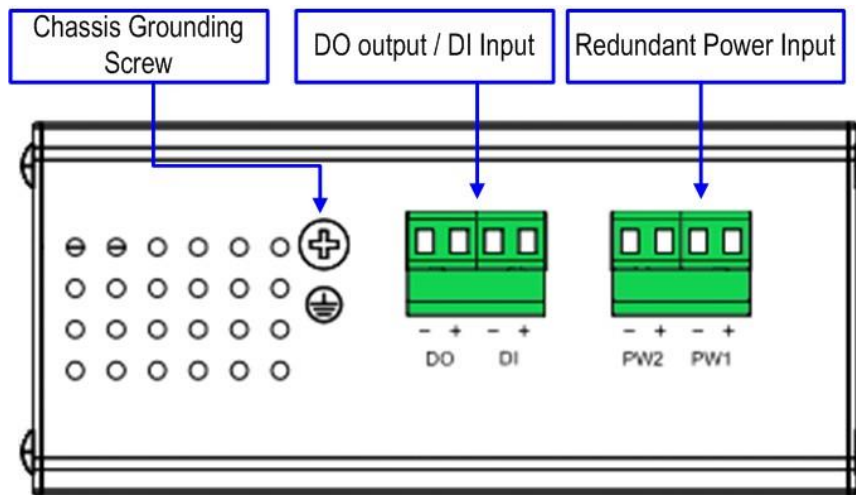

The LED function is described as following table:

LED	Function	Behaviors
Power 1,2	Indicates the power input status	On: the input connector is on applying power.
SYS	Indicates the system operating status	On: System is ready to operating
DI	Indicates the digital input status	On: High level signal is applied
DO	Indicates the digital output (Relay output) status	Red On: the output is formed close circuit
R.S.	Indicates the ring operating status.	Normal (Green on), Abnormal (Yellow on), wrong ring port is connected (Green blinking), one of device"s ring path is broken (Yellow blinking)
Link/active	Indicated the traffic status and link	On: port is linked with partner.

	status	Blinking: the port is on transmitting or receiving data.
--	--------	--

Bottom View

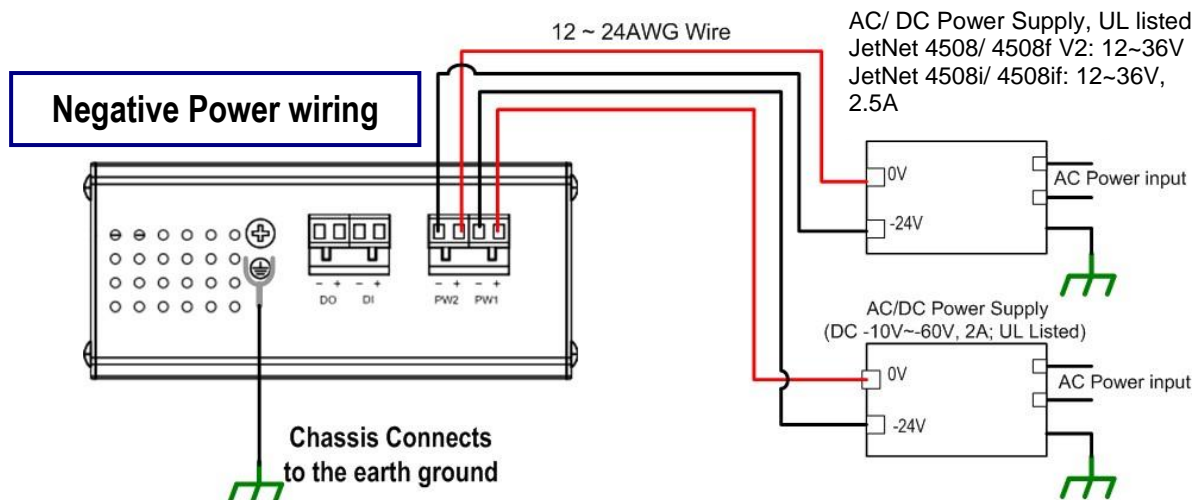

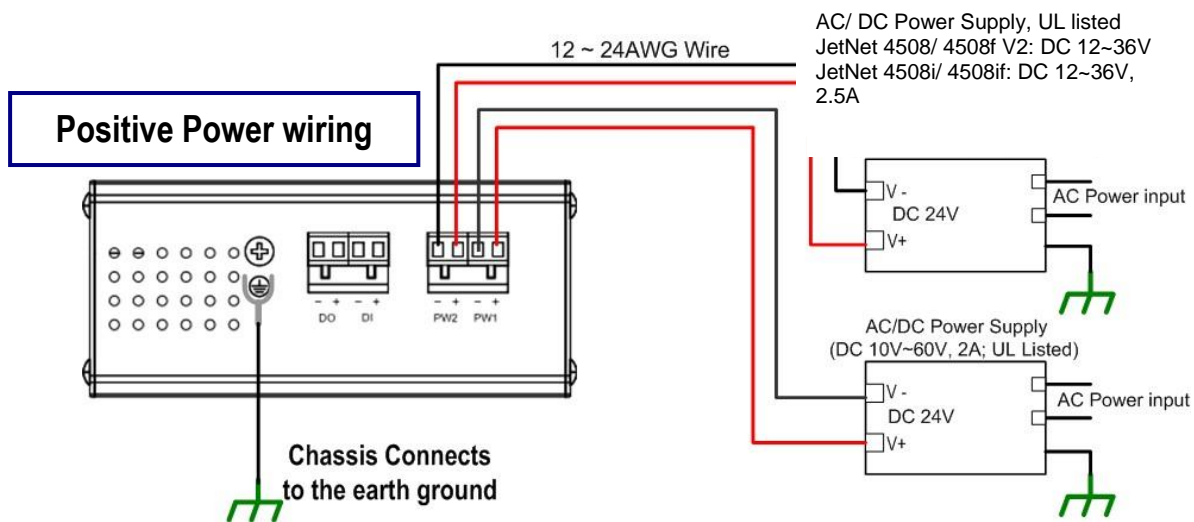

The bottom view of the JetNet 4508 V2 / JetNet 4508f V2 consists of two terminal block connectors with two DC power inputs, one Digital Input (DI), one Relay Output (DO) and one Chassis Grounding screw.

2.2 Wiring the Power Inputs

Follow below steps to wire JetNet 4508V2 /4508f V2 redundant DC power inputs.

1. Insert positive and negative wires into V+ and V- contacts respectively of the terminal block connector
2. Tighten the wire-clamp screws to prevent DC wires from being loosened.
3. Power 1 and Power 2 support power redundancy and polarity reverse protect function. That means with wrong polarity, the system won't work.
4. Positive and negative power system inputs are both accepted, but Power 1 and Power 2 must apply with same mode as following figures.

Note 1: It is a good practice to turn off input and load power, and to unplug power terminal block before making wire connections. Otherwise, your screwdriver blade can inadvertently short your terminal connections to the grounded enclosure.

Note 2: The range of the suitable electric wire is from 12 to 24 AWG.

Note 3: If the 2 power inputs are connected, JetNet Switch will be powered from the highest connected voltage. The unit will alarm for loss of power, either PWR1 or PWR2 and auto backup with each other.

Note 4: JetNet 4508 v2/ JetNet 4508f v2 series, uses the UL Listed Power supply with output Rating 10-60 Vdc, minimum 2 A. Here, we recommended use DC 24V as the operating voltage.

JetNet 4508i/ JetNet 4508if series, uses the UL Listed Power supply with output Rating 12-36 Vdc, minimum 2.5 A. Here, we recommended use DC 24V as the operating voltage.

Note 5: Once the system powering on, the system diagnostic LEDs will activate as the sequence shown in the following table:

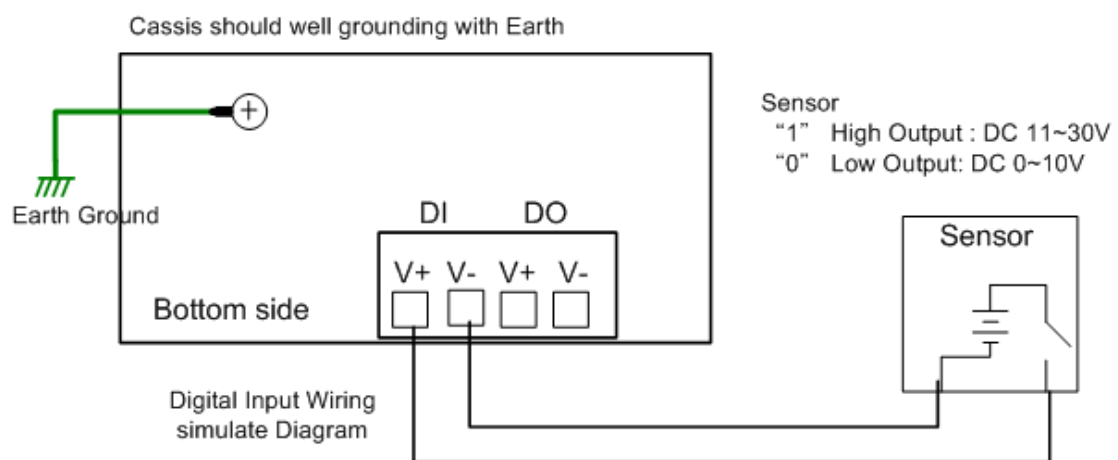

Indicators	Stage 1	Stage 2	Stage 3	Stage 4	Stage 5	Stage 6
Power LED	On	On	On	On	On	On
DI	Off	On	Off	Off	Off	Off
DO	Off	Off	On	Off	Off	Off
R.S.	Off	Off	Off	On	Off	Off
SYS	Off	Off	Off	Off	Off	On
Description	Power on	Ex. Booter	Ld. firmware	Ex. firmware	System booting	System Ready

By those LED indicators, we can know the exactly stage is performed during the system power on.

2.3 Wiring Digital Input

JetNet 4508/JetNet 4508f series provide one digital input. It allows users to connect the termination units' digital output and manage/monitor the status of the connected unit. The Digital Input pin can be pulled high or low; thus the connected equipments can actively drive these pins high or low. The embedded software UI allows you to read and set the value to the connected device.

The power input voltage of logic low is DC 0~10V. Logic high is DC 11~30V.

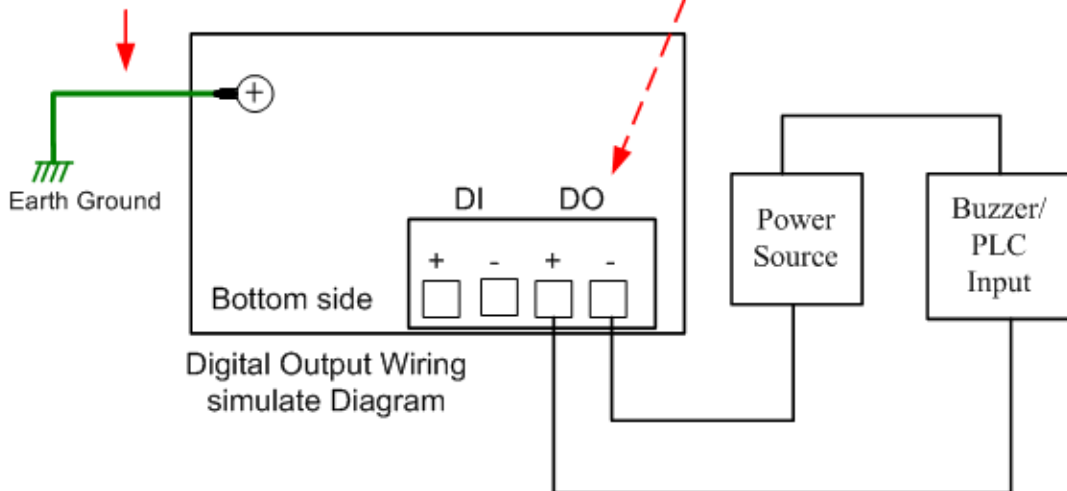

2.4 Wiring Relay Output

JetNet 4508/4508f series provide one Digital output, also known as Dry Relay Output. The relay contacts are energized (open) for normal operation and will close for fault conditions. The fault conditions include power failure, Ethernet port link break or other pre-defined events which can be configured in JetNet 4508 Web user interface.

Chassis should well grounding with Earth

DO (Relay) carry current: 1A/DC 24V

2.5 Wiring Earth Ground

To ensure the system will not be damaged by noise or any electrical shock, we suggest you to make exact connection with JetNet 4508 / 4508f series with Earth Grounding.

On the bottom side of JetNet 4508/ 4508f series, there is one earth ground screw. Loosen the earth ground screw by screw driver; then tighten the screw after earth ground wire is well connected.

Without the exact system chassis grounding, the communication may be interfered by the external noise, such as lightning, fast electrical field transient or electrostatic discharge.

2.6 Wiring Fast Ethernet RJ-45 Ports

The JetNet 4508 / 4508f series adopts several of RJ-45 connectors which support 10/100Base-TX with link speed auto negotiation and auto MDI/MDI-X functions.

All the RJ-45 ports will auto-detect the signal from connected devices to negotiate the link speed and duplex mode. Auto MDI/MDIX allows users to connect another switch, hub or workstation without changing straight through or crossover cable.

Note: that crossover cables simply cross-connect the transmit lines at each end to the received lines at the opposite end.

Pin MDI-X	Signals	MDI Signals
1	RD+	TD+
2	RD-	TD-
3	TD+	RD+
6	TD-	RD-

Connect one side of an Ethernet cable into any switch port and connect the other side to your attached device. The LNK LED will light up when the cable is correctly connected. Refer to the LED Indicators section for descriptions of each LED indicator. Always make sure that the cables between the switches and attached devices (e.g. switch, hub, or workstation) are less than 100 meters (328 feet).

The supported cable types listed as below:

100Base-TX: 4-pair UTP/STP Cat. 5 Cable, EIA/TIA-568B 100-ohm (100 meters)

10Base-T: 4-pair UTP/STP Cat.3, 4 cable, EIA/TIA-568B 100-ohm (100meters)

2.7 Wiring Fast Ethernet Fiber port (JetNet 4508f V2)

JetNet 4508f V2 equipped 2 ports fiber which compliance with IEEE 802.3 100Base-FX standard and supports multi-mode or single mode fiber cable. The fiber connector supports SC type connector and for the other type connector, please contacts your Korenix distributor for more information. To ensure the quality of connection, the specifications of cable and fiber port must matched; with wrong fiber cable may caused the communication does not work well. The following information is the specification includes suitable cable and the characteristics of fiber port.

Model	TX power	RX sensitivity	Wavelength	Fiber Cable
JetNet 4508f-s V2, 30KM	-8~-15 dBm	-31~-14dBm	1310nm	8~10/125 um Single mode
JetNet 4508f-m V2 2KM	-14~-31 dBm	-14~-31 dBm	1310nm	50~62.5/125um Multi-mode

2.8 Wiring RS-232 Console Cable

There is one RS-232 DB-9 to RJ-45 cable shipped with the box. Connects the DB-9 connector to the COM port of your PC, open Terminal tool and configure the serial communication parameter to 9600, N, 8, 1. (Baud Rate: 9600bps / Parity: None / Data length: 8bits / Stop Bit: 1) Then you can access CLI interface by console able.

Note: If you lost the cable, please contact with your sales or follow the pin assignment to buy a new one. The Pin assignment spec is listed following.

RJ-45 Pin	DB-9 Pin	Description
1	8	N/A
2	9	N/A
3	2	TxD
4	1	N/A
5	5	GND
6	3	RxD
7	4	N/A
8	7	N/A

DB-9 Female Connector

2.9 DIN-Rail Mounting Installation

The DIN-Rail clip is already screwed tight on the rear side of JetNet JetNet 4508V2/ JetNet 4508f V2 when shipping. If the DIN-Rail clip is not screwed on the JetNet 4508 V2/ JetNet 4508f V2, please contact your distributor to get the DIN rail clip set. The DIN rail clip supports EN50022 standard. In the diagram following includes the dimension of EN50022 DIN rail for your refer.

Follow the steps below to mount JetNet Managed Switch to the DIN-Rail track:

1. First, insert the DIN-Rail track upper side into the upper end of DIN-Rail clip.
2. Lightly push the bottom of DIN-Rail clip into the track.
3. Check if DIN-Rail clip is tightly attached on the track.
4. To remove JetNet 4508V2/ JetNet 4508f V2 from the track, reverse the steps above.

Notes: The DIN Rail should compliance with DIN EN50022 standard. Using wrong DIN rail may cause system install unsafe.

3 Preparation for Management

JetNet 4508/4508f series Industrial Managed Fast Ethernet Switch provides both in-band and out-band configuration methods. You can configure the switch via RS232 console port via serial cable attached in the package if you don't attach your admin PC to your network, or if you lose network connection to the target JetNet Switch. This is so-called out-band management. It wouldn't be affected by network performance.

The in-band management means you can remotely manage the switch via the Ethernet network. You can choose Telnet or Web-based management. You just need to know the device's IP address and you can remotely connect to its embedded HTTP web pages or Telnet console.

Following topics are covered in this chapter:

3.1 Preparation for Serial Console

3.2 Preparation for Web Interface

3.3 Preparation for Telnet console

3.1 Preparation for Serial Console

In package, Korenix attached one RS-232 DB-9 to RJ-45 console cable. Please attach RS-232 DB-9 connector to your PC COM port, connect RJ-45 to the Console port of the JetNet Switch. If you lose the cable, please follow the console cable PIN assignment to find one. (Refer to session 2.8).

1. Go to Start -> Program -> Accessories -> Communication -> Hyper Terminal
2. Give a name to the new console connection.
3. Choose the COM name
4. Select correct serial settings. The serial settings of JetNet switch are as below:
Baud Rate: 9600 / Parity: None / Data Bit: 8 / Stop Bit: 1
5. After connected, you can see Switch login request.
6. Login the switch. The default username is "admin", and password is "admin".

3.2 Preparation for Web Interface

JetNet 4508 / 4508f provides HTTP Web Interface and Secured HTTPS Web Interface for web management. The Web user interface supports 2 languages – English and simplified Chinese, you can select language type while performs login process.

3.2.1 Web Interface

Korenix web management page is developed by JAVA. It allows you to use a standard web-browser such as Microsoft Internet Explorer, or Mozilla, to configure and interrogate the switch from anywhere on the network.

Before you attempt to use the embedded web interface to manage switch operation, verify that your JetNet 4508 V2/ 4508f V2 is properly installed on your network and that every PC on this network can access the switch via the web browser.

1. Verify that your network interface card (NIC) is operational, and that your operating system supports TCP/IP protocol.
2. Wire DC power to the switch and connect your switch to your computer.
3. Make sure that the switch default IP address is 192.168.10.1.
4. Change your computer IP address to 192.168.10.2 or other IP address which is located in the 192.168.10.x (Network Mask: 255.255.255.0) subnet.
5. Switch to DOS command mode and ping 192.168.10.1 to verify a normal response time.

Launch the web browser and Login.

6. Launch the web browser (Internet Explorer or Mozilla Firefox) on the PC.
7. Type **http://192.168.10.1** (or the IP address of the switch). And then press **Enter**.
8. The login screen will appear next.
9. Key in user name and the password. Default user name and password are both **admin**.
10. Select language type, the default is English. This feature is available from firmware v1.1.

Click on **Enter** or **OK**. Welcome page of the web-based management interface will then appear.

Once you enter the web-based management interface, you can freely change the JetNet's IP address to fit your network environment.

Note 1: IE 5.0 or later versions do not allow Java applets to open sockets by default. Users have to directly modify the browser settings to selectively enable Java applets to use network ports.

Note 2: The Web UI connection session of JetNet Switch will be logged out automatically if you don't give any input after 30 seconds. After logged out, you should re-login and key in correct user name and password again.

3.2.2 Secured Web Interface

Korenix web management page also provides secured management HTTPS login. All the configuration commands will be secured and will be hard for the hackers to sniff the login password and configuration commands.

Launch the web browser and Login.

1. Launch the web browser (Internet Explorer or Mozilla Firefox) on the PC.
2. Type **https://192.168.10.1** (or the IP address of the switch). And then press **Enter**.
3. The popup screen will appear and request you to trust the secured HTTPS connection distributed by JetNet 4508 V2/JetNet 4508f V2 first. Press **Yes** to trust it. (Uses JeNet 5010G sample)

4. The login screen will appear next.

5. Key in the user name and the password. The default user name and password is **admin**.
6. Click on **Enter** or **OK**. Welcome page of the web-based management interface will then appear.
7. Once you enter the web-based management interface, all the commands you see are the same as what you see by HTTP login.

3.3 Preparation for Telnet Console

3.3.1 Telnet

Korenix Managed Switch supports Telnet console. You can connect to the switch by Telnet and the command lines are the same as what you see by RS-232 console port. Below are the steps to open Telnet connection to the switch.

1. Go to Start -> Run -> cmd. And then press **Enter**
2. Type the **Telnet 192.168.10.1** (or the IP address of the switch). And then press **Enter**

3.3.2 SSH (Secure Shell)

Korenix Managed Switch also support SSH console. You can remotely connect to the switch by command line interface. The SSH connection can secure all the configuration commands you sent to the switch.

SSH is a client/server architecture while the Switch is the SSH server. When you want to make SSH connection with the switch, you should download the SSH client tool first.

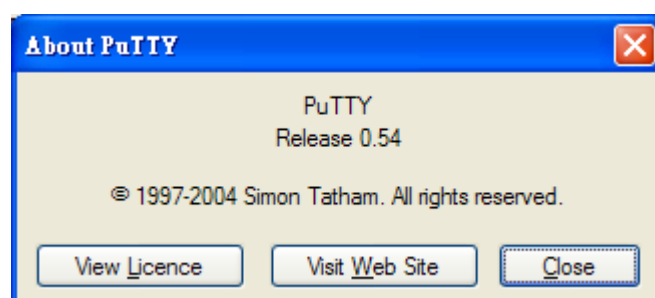

SSH Client

There are many free, sharewares, trials or charged SSH clients you can find on the internet. Fox example, PuTTY is a free and popular Telnet/SSH client. We'll use this tool to demonstrate how to login JetNet by SSH. Note: *PuTTY is copyright 1997-2006 Simon Tatham.*

Download PuTTY:

<http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html>

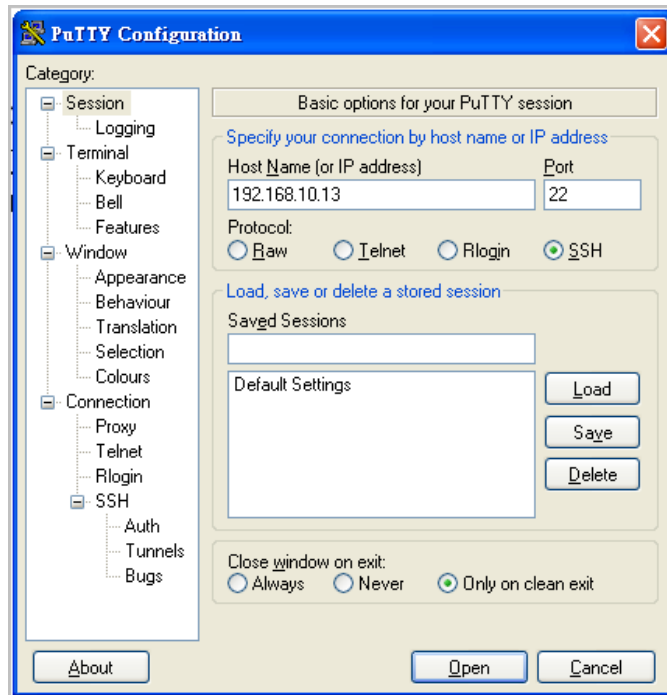

The copyright of **PuTTY**

1. Open SSH Client/PuTTY

In the **Session** configuration, enter the **Host Name** (IP Address of your JetNet Switch) and **Port number** (default = 22). Choose the “**SSH**” protocol. Then click on “**Open**” to start the SSH session console.

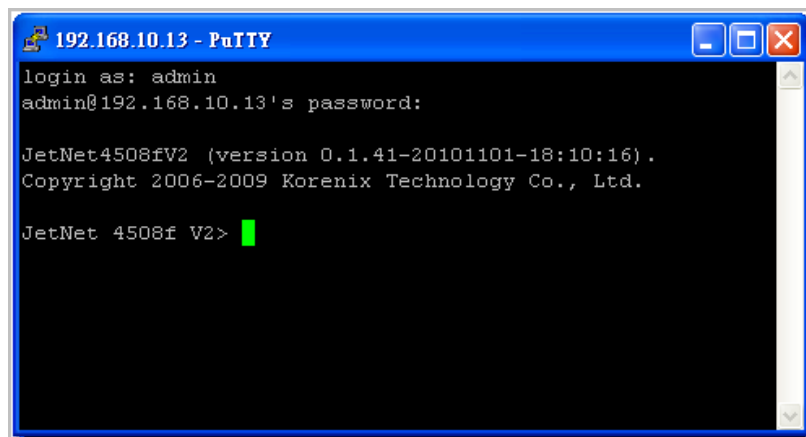

(The sample’s IP address is 192.168.10.13)

2. After click on **Open**, then you can see the cipher information in the popup screen. Press **Yes** to accept the Security Alert.

3. After few seconds, the SSH connection to Switch is opened. You can see the login screen as the below figure.

```
192.168.10.13 - PuTTY
login as: admin
admin@192.168.10.13's password:

JetNet4508fV2 (version 0.1.41-20101101-18:10:16).
Copyright 2006-2009 Korenix Technology Co., Ltd.

JetNet 4508f V2>
```

4. Type the Login Name and its Password. The default Login Name and Password are **admin / admin**.
5. All the commands you see in SSH are the same as the CLI commands you see via RS232 console. The next chapter will introduce in detail how to use command line to configure the switch.

4 Feature Configuration

This chapter explains how to configure the software features. There are four ways to access the switch: Serial console, Telnet, Web browser and SNMP.

The Industrial Managed Switch provides both in-band and out-band configuration methods. You can configure the switch via RS-232 console cable if you don't attach your admin PC to your network, or if you lose the network connection to your JetNet JetNet 4508 V2/JetNet 4508f V2. This is so-called out-band management. It wouldn't be affected by the network performance.

The in-band management means you can remotely manage the switch via the network. You can choose Telnet or Web-based management. You just need to know the device's IP address. Then you can remotely connect to its embedded HTML web pages or Telnet console.

Korenix web management page is developed by JAVA. It allows you to use a standard web-browser such as Microsoft Internet Explorer, or Mozilla, to configure and interrogate the switch from anywhere on the network.

Note: IE 5.0 or later versions do not allow Java applets to open sockets by default. Users have to directly modify the browser settings to selectively enable Java applets to use network ports.

Following topics are covered in this chapter:

- 4.1 Command Line Interface (CLI) Introduction
- 4.2 Basic Setting
- 4.3 Port Configuration
- 4.4 Network Redundancy
- 4.5 VLAN
- 4.6 Traffic Prioritization
- 4.7 Multicast Filtering
- 4.8 SNMP
- 4.9 Security
 - 4.10 Warning
 - 4.11 Monitor and Diag
 - 4.12 Device Front Panel
 - 4.13 Save
 - 4.14 Logout

4.1 Command Line Interface Introduction

The Command Line Interface (CLI) is the user interface to the switch's embedded software system. You can view the system information, show the status, configure the switch and receive a response back from the system by keying in a command.

There are some different command modes. Each command mode has its own access ability, available command lines and uses different command lines to enter and exit. These modes are User EXEC, Privileged EXEC, Global Configuration, (Port/VLAN) Interface Configuration modes.

User EXEC mode: As long as you login the switch by CLI. You are in the User EXEC mode. You can ping, telnet remote device, and show some basic information.

Type **enable** to enter next mode, **exit** to logout. **?** to see the command list

Switch>	
enable	Turn on privileged mode command
exit	Exit current mode and down to previous mode
list	Print command list
ping	Send echo messages
quit	Exit current mode and down to previous mode
show	Show running system information
telnet	Open a telnet connection
traceroute	Trace route to destination

Privileged EXEC mode: Press enable in the User EXEC mode, then you can enter the Privileged EXEC mode. In this mode, the system allows you to view current configuration, reset default, reload switch, show system information, save configuration...and enter the global configuration mode.

Type **configure terminal** to enter next mode, **exit** to leave. **?** to see the command list

Switch#	
archive	manage archive files
clear	Reset functions
clock	Configure time-of-day clock
configure	Configuration from vty interface
copy	Copy from one file to another
debug	Debugging functions (see also 'undebug')
disable	Turn off privileged mode command
end	End current mode and change to enable mode
exit	Exit current mode and down to previous mode
list	Print command list
more	Display the contents of a file
no	Negate a command or set its defaults
ping	Send echo messages
quit	Exit current mode and down to previous mode
reboot	Reboot system
reload	copy a default-config file to replace the current one
show	Show running system information
telnet	Open a telnet connection
terminal	Set terminal line parameters
traceroute	Trace route to destination
write	Write running configuration to memory, network, or terminal

Global Configuration Mode: Press **configure terminal** in privileged EXEC mode. You can then enter global configuration mode. In global configuration mode, you can configure all the features that the system provides you.

Type **interface IFNAME/VLAN** to enter interface configuration mode, **exit** to leave this configuration level and **?** to list all of commands.

Available command lists of global configuration mode.

Switch# configure terminal	
Switch(config)#	
access-list	Add an access list entry
administrator	Administrator account setting
arp	Set a static ARP entry
clock	Configure time-of-day clock
default	Set a command to its defaults
end	End current mode and change to enable mode
exit	Exit current mode and down to previous mode
gvrp	GARP VLAN Registration Protocol
hostname	Set system's network name
interface	Select an interface to configure
ip	IP information
lacp	Link Aggregation Control Protocol
list	Print command list
log	Logging control
mac	Global MAC configuration subcommands
mac-address-table	mac address table
mirror	Port mirroring
no	Negate a command or set its defaults
ntp	Configure NTP
password	Assign the terminal connection password
qos	Quality of Service (QoS)
relay	relay output type information
smtp-server	SMTP server configuration
snmp-server	SNMP server
spanning-tree	spanning tree algorithm
super-ring	super-ring protocol
trunk	Trunk group configuration
vlan	Virtual LAN
warning-event	Warning event selection
write-config	Specify config files to write to

(Port) Interface Configuration: Press **interface IFNAME** in global configuration mode. You can then enter interface configuration mode. In this mode, you can configure port settings.

The port interface name for Fast Ethernet port 1~8 are fa1~fa8. Typing in the interface name accordingly when you want to enter certain interface configuration mode.

Type **exit** to leave this current level.

Type **?** to show the command list

Available command lists of the global configuration mode.

Switch(config)# interface fa1	
Switch(config-if)#	
acceptable	Configure 802.1Q acceptable frame types of a port.
auto-negotiation	Enable auto-negotiation state of a given port
description	Interface specific description
duplex	Specify duplex mode of operation for a port
end	End current mode and change to enable mode
exit	Exit current mode and down to previous mode
flowcontrol	Set flow-control value for an interface
garp	General Attribute Registration Protocol
ingress	802.1Q ingress filtering features
lacp	Link Aggregation Control Protocol
list	Print command list
loopback	Specify loopback mode of operation for a port
mac	MAC interface commands
mdix	Enable mdix state of a given port
no	Negate a command or set its defaults
qos	Quality of Service (QoS)
quit	Exit current mode and down to previous mode
rate-limit	Rate limit configuration
shutdown	Shutdown the selected interface
spanning-tree	spanning-tree protocol
speed	Specify the speed of a Fast Ethernet port or a Gigabit
Ethernet port.	
switchport	Set switching mode characteristics

(VLAN) Interface Configuration: Press **interface VLAN VLAN-ID** in global configuration mode. You can then enter VLAN interface configuration mode. In this mode, you can configure the settings for the specific VLAN.

The VLAN interface name of VLAN 1 is VLAN 1, VLAN 2 is VLAN 2...

Type **exit** to leave the mode. Type **?** to see the available command list.

The command lists of the VLAN interface configuration mode.

Switch(config)# interface vlan 1	
Switch(config-if)#	
description	Interface specific description
end	End current mode and change to enable mode
exit	Exit current mode and down to previous mode
ip	Interface Internet Protocol config commands
list	Print command list
no	Negate a command or set its defaults
quit	Exit current mode and down to previous mode
shutdown	Shutdown the selected interface

Summary of the 5 command modes.

Command Mode	Main Function	Enter and Exit Method	Prompt
User EXEC	This is the first level of access. User can ping, telnet remote device, and show some basic information	Enter: Login successfully Exit: exit to logout. Next mode: Type enable to enter privileged EXEC mode.	Switch>
Privileged EXEC	In this mode, the system allows you to view current configuration, reset default, reload switch, show system information, save configuration...and enter global configuration mode.	Enter: Type enable in User EXEC mode. Exec: Type disable to exit to user EXEC mode. Type exit to logout Next Mode: Type configure terminal to enter global configuration command.	Switch#
Global configuration	In global configuration mode, you can configure all the features that the system provides you	Enter: Type configure terminal in privileged EXEC mode Exit: Type exit or end or press Ctrl-Z to exit. Next mode: Type interface IFNAME/ VLAN VID to enter interface configuration mode	Switch(config)#
Port Interface configuration	In this mode, you can configure port related settings.	Enter: Type interface IFNAME in global configuration mode. Exit: Type exit or Ctrl+Z to global configuration mode. Type end to privileged EXEC mode.	Switch(config-if)#
VLAN Interface Configuration	In this mode, you can configure settings for specific VLAN.	Enter: Type interface VLAN VID in global configuration mode. Exit: Type exit or Ctrl+Z to global configuration mode. Type end to privileged EXEC mode.	Switch(config-vlan)#

Here are some useful commands for you to see these available commands. Save your time in typing and avoid typing error.

? To see all the available commands in this mode. It helps you to see the next command you can/should type as well.

```
Switch(config)# interface ?  
IFNAME  Interface's name  
vlan    Select a vlan to configure
```

(Character) ? To see all the available commands starts from this character.

```
Switch(config)# a?  
access-list  Add an access list entry  
administrator Administrator account setting  
arp          Set a static ARP entry
```

Tab This tab key helps you to input the command quicker. If there is only one available command in the next, clicking on tab key can help to finish typing soon.

```
Switch# co (tab) (tab)  
Switch# configure terminal  
  
Switch(config)# ac (tab)  
Switch(config)# access-list
```

Ctrl+C To stop executing the unfinished command.

Ctrl+S To lock the screen of the terminal. You can't input any command.

Ctrl+Q To unlock the screen which is locked by Ctrl+S.

Ctrl+Z To exit configuration mode.

Alert message when multiple users want to configure the switch. If the administrator is in configuration mode, then the Web users can't change the settings. JetNet 4508 / 4508f allows only one administrator to configure the switch at same time.

4.2 Basic Setting

The Basic Setting group provides you to configure switch information, IP address, User's name/Password of the system. It also allows you to do firmware upgrade, backup and restore configuration, reload factory default, and reboot the system.

Following commands are included in this group:

- 4.2.1 Switch Setting
- 4.2.2 Admin Password
- 4.2.3 IP Configuration
- 4.2.4 Time Setting
- 4.2.5 DHCP Server
- 4.2.6 Backup and Restore
- 4.2.7 Firmware Upgrade
- 4.2.8 Factory Default
- 4.2.9 System Reboot
- 4.2.10 CLI Commands for Basic Setting

4.2.1 Switch Setting

You can assign System name, Location, Contact and view system information.

Figure 4.2.1.1 – Web UI of the Switch Setting

Your Industrial Computing & Networking Partner	
System Name	JetNet 4508f V2
System Location	PM-Richard
System Contact	PM-Richard ext 200
System OID	1.3.6.1.4.1.24062.2.2.18
System Description	JetNet4508fV2 Industrial Managed Switch
Firmware Version	v0.1.41 20101101
MAC Address	00:12:77:ff:00:00
Product Name	JetNet4508fV2
Serial Number	
Manufacturing Date	

(Sampling device setting for System Location is “PM-Richard” and System Contact is “PM-Richard ext200)

System Name: You can assign a meaningful name to the device. The available characters you can input is 64. After you configure the name, CLI system will select the first 12 characters as the name in CLI system.

System Location: You can specify the switch's physical location here. The available characters you can input are 64.

System Contact: You can specify contact people here. You can type the name, mail address or other information of the administrator. The available characters you can input are 64.

System OID: The SNMP object ID of the switch. You can follow the path to find its private MIB in MIB browser. (**Note:** When you attempt to view private MIB, you should compile private MIB files into your MIB browser first.)

System Description: the real product model name of this product.

Firmware Version: Display the firmware version installed in this device.

MAC Address: Display unique hardware address (MAC address) assigned by the manufacturer.

Product Name: Display the Switch's model name

Serial Number: Display the Switch's serial number

Manufacture Date: Display the switch's production date.

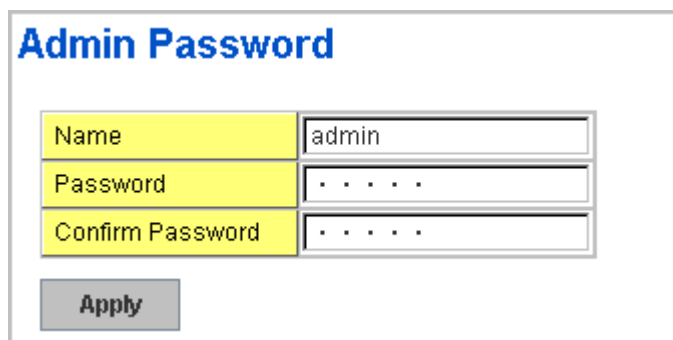

Once you finish the configuration, click on **Apply** to apply your settings.

Note: Always remember to select **Save** to save your settings. Otherwise, the settings you made will be lost when the switch is powered off.

4.2.2 Admin Password

You can change the user name and the password here to enhance security

Figure 4.2.2.1 Web UI of the Admin Password

Admin Password	
Name	admin
Password
Confirm Password
<input type="button" value="Apply"/>	

Name: You can key in new user name here. The default setting is **admin**.

Password: You can key in new password here. The default setting is **admin**.

Confirm Password: You need to type the new password again to confirm it.

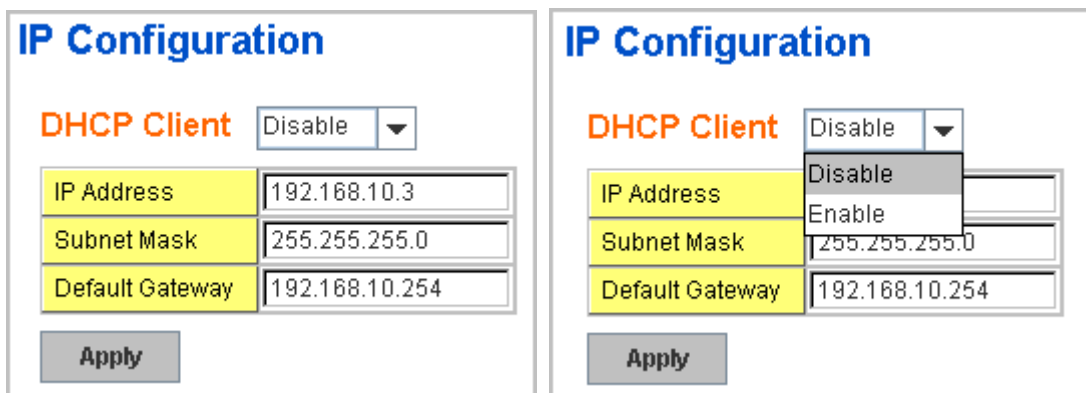

Once you finish configuring the settings, click on **Apply** to apply your configuration.

Figure 4.2.2.2 Popup alert window for Incorrect Username.

4.2.3 IP Configuration

This function allows users to configure the switch's IP address settings.

DHCP Client: You can select to **Enable** or **Disable** DHCP Client function. When DHCP Client function is enabled, an IP address will be assigned to the switch from the network's DHCP server. In this mode, the default IP address will therefore be replaced by the one assigned by DHCP server. If DHCP Client is disabled, then the IP address that you specified will be used instead.

IP Address: You can assign the IP address reserved by your network for your JetNet. If DHCP Client function is enabled, you don't need to assign an IP address to the JetNet, as it will be overwritten by DHCP server and shown here. The default IP is 192.168.10.1.

Subnet Mask: You can assign the subnet mask for the IP address here. If DHCP Client function is enabled, you don't need to assign the subnet mask. The default Subnet Mask is 255.255.255.0. **Note:** In the CLI, we use the enabled bit of the subnet mask to represent the number displayed in web UI. For example, 8 stands for 255.0.0.0; 16 stands for 255.255.0.0; 24 stands for 255.255.255.0.

Default Gateway: You can assign the gateway for the switch here. The default gateway is 192.168.10.254. **Note:** In CLI, we use 0.0.0.0/0 to represent for the default gateway.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.2.4 Time Setting

Time Setting source allow user to set the time manually or through NTP server. Network Time Protocol (NTP) is used to synchronize computer clocks on the internet. You can configure NTP settings here to synchronize the clocks of several switches on the network.

The IEEE1588 PTP (Precision Time Protocol) supports very precise time synchronization in an Ethernet network. There are two clocks, Master and Slave. The master device periodically launches an exchange of messages with slave devices to help each slave clock re-compute the offset between its clock and the master's clock.

*Note: Please enable one synchronization protocol (PTP/NTP) only.

The JetNet Switch also provides Daylight Saving function for some territories use.

Time Setting

System Time: Thu Jan 1 00:07:36 2009

Time Setting Source	Manual Setting
Manual Setting	Get Time From PC
Jan	01, 2009 00 : 07 : 36

IEEE 1588	
PTP State	Disable
Mode	Auto

Timezone Setting	
Timezone	(GMT-07:00) Mountain Time (US & Canada)

<input type="checkbox"/> Daylight Saving Time	
Daylight Saving Start	2nd Sun in Jun at 00 : 00
Daylight Saving End	4th Sat in Sep at 00 : 00

Manual Setting: User can select Manual setting to change time as user wants. User also can click the button “**Get Time from PC**” to get PC’s time setting for switch.

NTP client: Select the Time Setting Source to **NTP client** can let device enable the NTP client service. NTP client will be automatically enabled if you change Time source to NTP Client. The system will send request packet to acquire

current time from the NTP server you assigned.

Time Setting Source	NTP Client
NTP Client	Manual Setting
Primary Server Address	NTP Client
	192.168.10.120
Secondary Server Address	192.168.10.121

IEEE 1588: select the **PTP State** to enable this function and select one operating mode for the precision time synchronizes.

Auto mode: the switch performs PTP Master and slave mode (Boundary mode)

Master mode: switch performs PTP Master only.

Slave mode: switch performs PTP slave only.

IEEE 1588	
PTP State	Enable
Mode	Auto
Timezone Setting	
Timezone	(GMT) Greenwich Mean Time

Time-zone: Select the time zone where the switch is located. Following table lists the time zones for different locations for your reference. The default time zone is GMT Greenwich Mean Time.

```
Switch(config)# clock timezone
01 (GMT-12:00) Eniwetok, Kwajalein
02 (GMT-11:00) Midway Island, Samoa
03 (GMT-10:00) Hawaii
04 (GMT-09:00) Alaska
05 (GMT-08:00) Pacific Time (US & Canada) , Tijuana

- 72 (GMT+12:00) Auckland, Wellington
- 73 (GMT+12:00) Fiji, Kamchatka, Marshall Is.
- 74 (GMT+13:00) Nuku'alofa

Daylight Saving Time: click the check box to enable the Daylight Saving Function as the setting of start and end time or disable it.

Daylight Saving Start and **Daylight Saving End**: the time setting allows user to select the week that monthly basis, and sets the End and Start time individually.

Once you finish those configurations, click on **Apply** to apply your configuration.

4.2.5 DHCP Server

You can select to **Enable** or **Disable** DHCP Server function. *The Switch* will assign a new IP address to link partners, and also supports DHCP server option 82 with forwarding policy, and provides port-based DHCP server with IP address binding feature.

DHCP Server configuration

After selecting to enable DHCP Server function, type in the Network IP address for the DHCP server IP pool, Subnet Mask, Default Gateway address and Lease Time for client.

DHCP Server

DHCP Server Configuration

Network	<input type="text" value="192.168.10.0"/>
Subnet Mask	<input type="text" value="255.255.255.0"/>
Default Gateway	<input type="text" value="192.168.10.1"/>
Lease Time(s)	<input type="text" value="604800"/>

Once you have finished the configuration, click **Apply** to apply your configuration

Excluded Address:

You can type a specific address into the **IP Address field** for the DHCP server reserved IP address.

The IP address that is listed in the **Excluded Address List Table** will not be assigned to the network device. Add or remove an IP address from the **Excluded Address List** by clicking **Add** or **Remove**.

Excluded Address

IP Address

Excluded Address List

Index	IP Address
1	192.168.10.200

Manual Binding: *it* provides a MAC address and IP address binding and removing function. You can type in the specified IP and MAC address, and then click **Add** to add a new MAC&IP address binding rule for a specified link partner, like PLC or any device without **DHCP client** function. To remove from the binding list, just select the rule to remove and click **Remove**.

Manual Binding

IP Address	192.168.10.201
MAC Address	0012.7760.aaa1

Manual Binding List

Index	IP Address	MAC Address	
1	192.168.10.200	0012.7760.aaaa	▲

DHCP Leased Entries: *it* provides an assigned IP address list for user check. It will show the MAC and IP address that was assigned by *Switch*. Click the **Reload** button to refresh the listing.

DHCP Leased Entries

Index	Binding	IP Address	MAC Address	Lease Time(s)
1	Auto	192.168.0.3	0012.77ff.0530	604785

Reload

DHCP Relay Agent

You can select to **Enable** or **Disable** DHCP relay agent function, and then select the modification type of option 82 field, circuit ID, remote ID.

Relay policy drop: Drops the option 82 field and do not add any option 82 field.

Relay policy keep: Keeps the original option 82 field and forwards to server.

Relay policy replace: Replaces the existing option 82 field and adds new DHCP option 82 field. (This is the default setting)

Helper Address: there are 4 fields for the DHCP server's IP address. You can fill the field with preferred IP address of DHCP Server, and then click "Apply" to activate the DHCP relay agent function. All the DHCP packets from client will be modified by the policy and forwarded to DHCP server through the gateway port.

4.2.6 Backup and Restore

With Backup command, you can save current configuration file saved in the switch's flash to admin PC or TFTP server. This will allow you to go to **Restore** command later to restore the configuration file back to the switch. Before you restore the configuration file, you must place the backup configuration file in the PC or TFTP server. The switch will then download this file back to the flash.

There are 2 modes for users to backup/restore the configuration file, Local File mode and TFTP Server mode.

Local File mode: In this mode, the switch acts as the file server. Users can browse the target folder and then type the file name to backup the configuration. Users can also browse the target folder and select existed configuration file to restore the configuration back to the switch. This mode is only provided by Web UI while CLI is not supported.

TFTP Server mode: In this mode, the switch acts as TFTP client. Before you do so, make sure that your TFTP server is ready. Then please type the IP address of TFTP Server and Backup configuration file name. This mode can be used in both CLI and Web UI.

TFTP Server IP Address: You need to key in the IP address of your TFTP Server here.

Backup/Restore File Name: Please type the correct file name of the configuration file..

Configuration File: The configuration file of the switch is a pure text file. You can open it by word/txt read file. You can also modify the file, add/remove the configuration settings, and then restore back to the switch.

Startup Configuration File: After you saved the running-config to flash, the new settings will be kept and work after power cycle. You can use *show startup-config* to view it in CLI. The Backup command can only backup such configuration file to your PC or TFTP server.

Technical Tip:

Default Configuration File: The switch provides the default configuration file in the system. You can use Reset button, Reload command to reset the system.

Running Configuration File: The switch's CLI allows you to view the latest settings running by the system. The information shown here is the settings you set up but haven't saved to flash. The settings not yet saved to flash will not work after power recycle. You can use *show running-config* to view it in CLI.

Backup Configuration TFTP Server ▼

TFTP Server IP 192.168.0.100

Backup File Name Backup1.conf

Backup

Type the IP address of TFTP Server IP. Then click on **Backup/Restore**.

Note: point to the wrong file will cause the entire configuration missed

4.2.7 Firmware Upgrade

In this section, you can update the latest firmware for your switch. Korenix provides the latest firmware in Korenix Web site. The new firmware may include new features, bug fixes or other software changes. We'll also provide the release notes for the update as well. For technical viewpoint, we suggest you use the latest firmware before installing the switch to the customer site.

Note: the system will automatically reboot after you finished upgrading new firmware. Please remind the attached users before you do that.

Figure 4.2.7.1 Main UI of Firmware Upgrade

Your Industrial Computing & Networking Partner

Firmware Upgrade

System Firmware Version: v1.2
System Firmware Date: 20070620

Firmware Upgrade Local File

Firmware File Name TPJetNet5010G-v1.2.bin

Note: When firmware upgrade is finished, the switch will restart automatically.

Upgrade

Sample Web UI of JetNet 5010G firmware upgrade

There are 2 modes for users to backup/restore the configuration file, Local File mode and TFTP Server mode.

Local File mode: In this mode, the switch acts as the file server. Users can browse the target folder and then type the file name to backup the configuration. Users also can browse the target folder and select the existed configuration file to restore the configuration back to the switch. This mode is only provided by Web UI while CLI is not supported.

TFTP Server mode: In this mode, the switch acts as the TFTP client. Before you do so, make sure that your TFTP server is ready. And then please type the IP address of TFTP Server IP address. This mode can be used in both CLI and Web UI.

TFTP Server IP Address: You need to key in the IP address of your TFTP Server here.

Firmware File Name: The file name of the new firmware.
The UI also shows you the current firmware version and built date of current firmware. Please check the version number after the switch is rebooted.

Figure 4.2.7.2 Firmware Upgrade - Local File mode.

Firmware Upgrade

System Firmware Version: v1.2
System Firmware Date: 20070620

Firmware Upgrade Local File ▼

Firmware File Name TPJetNet5010G-v1.2.bin 

Note: When firmware upgrade is finished, the switch will restart automatically.

Upgrade

Click on Folder icon to select the target firmware file you want to upgrade.

Figure 4.2.7.3 Firmware Upgrade – TFTP Server mode.

Firmware Upgrade

System Firmware Version: v1.2
System Firmware Date: 20070620

Firmware Upgrade TFTP Server ▼

TFTP Server IP 192.168.0.100

Firmware File Name JetNet5010G-v1.2.bin

Note: When firmware upgrade is finished, the switch will restart automatically.

Upgrade

Type the IP address of TFTP Server and Firmware File Name. Then click on **Upgrade** to start the process.

After finishing transmitting the firmware, the system will copy the firmware file and replace the firmware in the flash. The CLI show until the process is finished.

4.2.8 Factory Default

In this section, you can reset all the configurations of the switch to default setting. Click on **Reset** the system will then reset all configurations to default setting. The system will show you pop-up message window after finishing this command. Default setting will work after rebooting the switch.

Figure- 4.2.8.1 The main screen of the Reset to Default

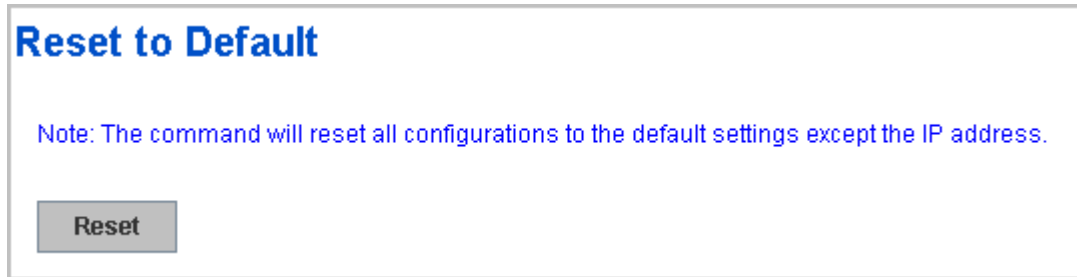

Figure 4.2.8.2 Popup alert screen to confirm the command. Click on **Yes** to start it.

Figure 4.2.8.3 Popup message screen to show you that have done the command. Click on **OK** to close the screen. Then please go to **Reboot** page to reboot the switch.

Click on **OK**. The system will then auto reboot the device.

Note: If you already configured the IP of your device to other IP address, when you use this command by CLI and Web UI, our software will not reset the IP address to default IP. The system will remain the IP address so that you can still connect the switch via the network.

4.2.9 System Reboot

System Reboot allows you to reboot the device. Some of the feature changes require you to reboot the system. Click on **Reboot** to reboot your device.

Note: Remember to click on **Save** button to save your settings. Otherwise, the settings you made will be gone when the switch is powered off.

Figure 4.2.9.1 Main screen for Rebooting

Figure 4.2.9.2 Pop-up alert screen to request confirmation. Click on **Yes**. Then the switch will be rebooted immediately.

Figure 4.2.9.3 Pop-up message screen appears when rebooting the switch.

4.2.10 CLI Commands for Basic Setting

Feature	Command Line

4.3 Port Configuration

Port Configuration group enables you to enable/disable port state, or configure port auto-negotiation, speed, and duplex, flow control, rate limit control and port aggregation settings. It also allows you to view port status and aggregation information.

Following commands are included in this group:

4.3.1 Port Control

4.3.2 Port Status

4.3.3 Rate Control

4.3.4 Port Trunking

4.3.5 Command Lines for Port Configuration

4.3.1 Port Control

Port Control commands allow you to enable/disable port state, or configure the port auto-negotiation, speed, duplex and flow control.

Port Configuration

Port	State	Speed/Duplex	Flow Control	Description
1	Enable	Auto Negotiation	Symmetric	Connect to ST-1
2	Enable	10 Full	Disable	
3	Enable	10 Half	Disable	
4	Enable	100 Full	Disable	
5	Enable	100 Half	Disable	
6	Enable	Auto Negotiation	Disable	
7	Enable	100 Full	Disable	
8	Enable	100 Full	Disable	

Select the port you want to configure and make changes to the port.

In **State** column, you can enable or disable the state of this port. Once you disable, the port stop to link to the other end and stop to forward any traffic. The default setting is Enable which means all the ports are workable when you receive the device.

In **Speed/Duplex** column, you can configure port speed and duplex mode of this port. Below are the selections you can choose:

JetNet 4508 (fa1~fa6)/ JetNet 4508f (fa1~fa6): Auto Negotiation, 10Half (10Mbps Half Duplex mode), 10 Full (10Mbps, Full Duplex mode), 100 Half (100Mbps, Half Duplex), 100 Full (100Mbps, Full Duplex mode)

JetNet 4508 (fa7, fa8): 100Mbps Auto Negotiation, 100 Full (100Mbps, Full Duplex mode), 100 Half (100Mbps, Half Duplex)

JetNet 4508f (fa7, fa8): Fiber port, 100Full (100Mbps, Full Duplex) only.

In **Flow Control** column, "Symmetric" means that you need to activate the flow control function of the remote network device in order to let the flow control of that corresponding port on the switch to work. "Disable" means that you don't need to activate the flow control function of the remote network device, as the flow control of that corresponding port on the switch will work anyway.

Once you finish configuring the settings, click on **Apply** to save the configuration.

Technical Tips: *If both ends are not at the same speed, they can't link with each other. If both ends are not in the same duplex mode, they will be connected by half mode.*

4.3.2 Port Status

The Port Status shows the current port you current port status. It includes connection type, port link status, exactly operating speed and duplex mode and the flow control setting.

Port Status					
Port	Type	Link	State	Speed/Duplex	Flow Control
1	100BASE-TX	Up	Enable	100 Full	Disable
2	100BASE	Down	Enable	–	Disable
3	100BASE	Down	Enable	–	Disable
4	100BASE	Down	Enable	–	Disable
5	100BASE-TX	Up	Enable	100 Full	Disable
6	100BASE-TX	Up	Enable	100 Full	Disable
7	100BASE-FX	Down	Enable	100 Full	Disable
8	100BASE-FX	Down	Enable	100 Full	Disable

The description of the columns is as below:

Port: Port interface number.

Type: 100TX -> Fast Ethernet port.

Link: Link status. Up -> Link UP. Down -> Link Down.

State: Enable -> State is enabled. Disable -> The port is disable/shutdown.

Speed/Duplex: Current working status of the port.

Flow Control: The state of the flow control.

4.3.3 Rate Control

The Rate Control feature allows user to limit the each port's data rate; the limitation mechanism is based on specified packet type. With the Ingress / Egress rate control feature, the network performance can be improved.

Rate Control

Limit Packet Type and Rate

Port	Ingress Packet Type	Ingress Rate(Mbps)	Egress Packet Type	Egress Rate(Mbps)
1	Broadcast Only	8	All	0
2	Broadcast Only	8	All	0
3	Broadcast/Multicast	8	All	0
4	Broadcast/Multicast/Unknown/Unicast	8	All	0
5	All	8	All	0
6	Broadcast Only	8	All	0
7	Broadcast Only	8	All	0
8	Broadcast Only	8	All	0

Rate Control is a form of flow control used to enforce a strict bandwidth limit at a port. You can program separate transmit (Egress Rule) and receive (Ingress Rule) rate limits at each port, and even apply the limit to certain packet types as described below.

Packet type: You can select the packet type that you want to filter. The packet types of the Ingress Rule listed here include **Broadcast Only** / **Broadcast and multicast** / **Broadcast, Multicast and Unknown Unicast** or **All**. The packet types of the Egress Rule (outgoing) only support **all** packet types.

Rate: This column allows you to manually assign the limit rate of the port. Valid values are from 1Mbps-100Mbps for fast Ethernet ports. The step of the rate is 1 Mbps. Default value of Ingress Rule is "8" Mbps; default value of Egress Rule is 0 Mbps. 0 stands for disabling the rate control for the port.

Click on **Apply** to apply the configuration.

4.3.4 Port Trunking

Port Trunking configuration allows you to group multiple Ethernet ports in parallel to increase link bandwidth. The aggregated ports can be viewed as one physical port so that the bandwidth is higher than merely one single Ethernet port. The member ports of the same trunk group can balance the loading and backup for each other. Port Trunking feature is usually used when you need higher bandwidth for backbone network. This is an inexpensive way for you to transfer more data.

There are some different descriptions for the port trunking. Different manufacturers may use different descriptions for their products, like Link Aggregation Group (LAG), Link Aggregation Control Protocol, Ethernet Trunk, Ether Channel...etc. Most of the implementations now conform to IEEE standard, 802.3ad.

The aggregated ports can interconnect to the other switch which also supports Port Trunking. Korenix Supports 2 types of port trunking. One is Static Trunk, the other is 802.3ad. When the other end uses 802.3ad LACP, you **should** assign 802.3ad LACP to the trunk. When the other end uses non-802.3ad, you can then use Static Trunk.

There are 2 configuration pages, Aggregation Setting and Aggregation Status.

Aggregation Setting

Port Trunk - Aggregation Setting

Port	Group ID	Trunk Type
1	Trunk 8	802.3ad LACP
2	Trunk 8	802.3ad LACP
3	Trunk 1	Static
4	Trunk 1	Static
5	None	Static
6	None	Static
7	None	Static
8	None	Static

Note: The port parameters of the trunk members should be the same.

Trunk Size: The switch can support up to 4 trunk groups and maximum trunk member up to 8 ports.

Group ID: Group ID is the ID for the port trunking group. Ports with same group ID are in the same group.

Trunk Type: **Static** and **802.3ad LACP**. Each Trunk Group can only support Static or 802.3ad LACP. Choose the type you need here.

Aggregation Status

This page shows the status of port aggregation. Once the aggregation ports are negotiated well, you will see following status.

Group ID	Type	Aggregated Ports	Individual Ports	Link Down Ports
Trunk 1	Static			3,4
Trunk 2				
Trunk 3				
Trunk 4				
Trunk 5				
Trunk 6				
Trunk 7				
Trunk 8	LACP			1,2

Reload

Group ID: Display Trunk 1 to Trunk 8 set up in Aggregation Setting.

Type: Static or LACP set up in Aggregation Setting. **(The JetNet 4508 V2 series only support 4 trunk groups.)**

Aggregated Ports: When LACP links well, you can see the member ports in aggregated column.

Individual Ports: When LACP is enabled, member ports of LACP group which are not connected to correct LACP member ports will be displayed in the Individual column.

Link Down ports: When LACP is enabled, member ports of LACP group which are not linked up will be displayed in the Link Down column.

4.3.5 Command Lines for Port Configuration

Feature	Command Line
Port Control	
Port Control – State	<p>Switch(config-if)# shutdown -> Disable port state Port1 Link Change to DOWN interface fastethernet1 is shutdown now.</p> <p>Switch(config-if)# no shutdown -> Enable port state Port1 Link Change to DOWN Port1 Link Change to UP interface fastethernet1 is up now. 4.4 Network Redundancy

It is critical for industrial applications that network remains non-stop. JetNet Switch firmware supports standard RSTP, Multiple Super Ring, Rapid Dual Homing and backward compatible with Legacy Super Ring Client modes.

Multiple Super Ring (**MSR™**) technology is **Korenix's** 3rd generation Ring redundancy technology. This is patented and protected by **Korenix** and is used in countries all over the world. MSR ranks the fastest restore and failover time in the world, 0 ms for restore and about 5 milliseconds for failover for copper.

Advanced Rapid Dual Homing (**RDH™**) technology also facilitates *JetNet managed Switch* to connect with a core managed switch easily and conveniently. With **RDH™** technology, you can also couple several Rapid Super Rings or RSTP cloud together, which is also known as Auto Ring Coupling.

To become backwards compatible with the Legacy Super Ring technology implemented in the *JetNet* series, *the JetNet 4508 series* also supports Super Ring Client mode. The Super Ring ports can pass through Super Ring control packets extremely well and works with Super Ring.

Besides Korenix ring technology, *JetNet Switch* also supports 802.1D-2004 version Rapid Spanning Tree Protocol (RSTP). New version of RSTP standard includes 802.1D-1998 STP, 802.1w RSTP, IEEE 802.1s MSTP (Multiple Spanning Tree). The MSTP function is available from 1.1 version firmwear, if your device does not support it, please download the new firmware from Korenix Web site.

Following commands are included in this group:

4.4.1 STP Configuration

4.4.2 Port Configuration

4.4.3 STP Information

4.4.4 MSTP Configuration

4.4.5 MSTP Port Configuration

4.4.6 MSTP Information

4.4.7 Multiple Super Ring

4.4.8 Multiple Super Ring Information

4.4.9 Command lines for network redundancy

4.4.1 STP Configuration

This page allows select the STP mode and configuring the global STP/RSTP Bridge Configuraiton.

The STP mode includes the **STP**, **RSTP**, **MSTP** and **Disable**. Please select

the STP mode for your system first. The default mode is RSTP enabled.

After select the STP or RSTP mode; continue to configure the global Bridge parameters for STP and RSTP.

After select the MSTP mode, please go to MSTP Configuration page.

STP Configuration

STP Mode

Bridge Configuration

Bridge Address	<input type="text" value="1212"/>
Bridge Priority	<input type="text" value=""/>
Max Age	<input type="text" value="20"/>
Hello Time	<input type="text" value="2"/>
Forward Delay	<input type="text" value="16"/>

RSTP (Refer to the 4.4.1 of previous version manual.)

RSTP is the abbreviation of Rapid Spanning Tree Protocol. If a switch has more than one path to a destination, it will lead to message loops that can generate broadcast storms and quickly bog down a network. The spanning tree was created to combat the negative effects of message loops in switched networks. A spanning tree uses a spanning tree algorithm (STA) to automatically sense whether a switch has more than one way to communicate with a node. It will then select the best path (primary), and block the other path(s). It will also keep track of the blocked path(s) in case the primary path fails. Spanning Tree Protocol (STP) introduced a standard method to accomplish this. It is specified in IEEE 802.1D-1998. Later, Rapid Spanning Tree Protocol (RSTP) was adopted and represents the evolution of STP, providing much faster spanning tree convergence after a topology change. This is specified in IEEE 802.1w. In 2004, 802.1w is included into 802.1D-2004 version. This switch supports both RSTP and STP (all switches that support RSTP are also backward compatible with switches that support only STP).

Bridge Configuration

Bridge Address: This shows the switch's MAC address.

Priority (0-61440): RSTP uses bridge ID to determine the root bridge, the bridge with the highest bridge ID becomes the root bridge. The bridge ID is composed of bridge priority and bridge MAC address. So that the bridge with the highest priority becomes the highest bridge ID. If all the bridge ID

has the same priority, the bridge with the lowest MAC address will then become the root bridge.

Note: The bridge priority value must be in multiples of 4096. A device with a lower number has a higher bridge priority. Ex: 4096 is higher than 32768.

Note: The Web GUI allows user select the priority number directly. This is the convenient of the GUI design. When you configure the value through the CLI or SNMP, you may need to type the value directly. Please follow the $n \times 4096$ rules for the Bridge Priority.

Max Age (6-40): Enter a value from 6 to 40 seconds here. This value represents the time that a bridge will wait without receiving Spanning Tree Protocol configuration messages before attempting to reconfigure.

If JetNet is not the root bridge, and if it has not received a hello message from the root bridge in an amount of time equal to Max Age, then JetNet will reconfigure itself as a root bridge. Once two or more devices on the network are recognized as a root bridge, the devices will renegotiate to set up a new spanning tree topology.

Hello Time (1-10): Enter a value from 1 to 10 seconds here. This is a periodic timer that drives the switch to send out BPDU (Bridge Protocol Data Unit) packet to check current STP status.

The root bridge of the spanning tree topology periodically sends out a “hello” message to other devices on the network to check if the topology is “healthy”. The “hello time” is the amount of time the root has waited during sending hello messages.

Forward Delay Time (4-30): Enter a value between 4 and 30 seconds. This value is the time that a port waits before changing from Spanning Tree Protocol learning and listening states to forwarding state.

This is the amount of time JetNet will wait before checking to see if it should be changed to a different state.

Once you have completed your configuration, click on **Apply** to apply your settings.

Note: You must observe the following rule to configure Hello Time, Forwarding Delay, and Max Age parameters.

$2 \times (\text{Forward Delay Time} - 1 \text{ sec}) \geq \text{Max Age Time} \geq 2 \times (\text{Hello Time value} + 1 \text{ sec})$

4.4.2 STP Port Configuration

This page allows you to configure the port parameter after enabled STP or RSTP.

Port Configuration

Select the port you want to configure and you will be able to view current setting and status of the port.

STP Port Configuration

Port	Path Cost	Priority	Link Type	Edge Port
1	20000	128	Auto	Enable
2	20000	128	Auto	Enable
3	20000	128	Auto	Enable
4	20000	128	Auto	Enable
5	20000	128	Auto	Enable
6	20000	128	Auto	Enable
7	20000	128	Auto	Enable
8	20000	128	Auto	Enable
9	20000	128	Auto	Enable

Path Cost: Enter a number between 1 and 200,000,000. This value represents the “cost” of the path to the other bridge from the transmitting bridge at the specified port.

Priority: Enter a value between 0 and 240, using multiples of 16. This is the value that decides which port should be blocked by priority in a LAN.

Link Type: There are 3 types for you select. **Auto**, **P2P** and **Share**.

Some of the rapid state transitions that are possible within RSTP depend upon whether the port of concern can only be connected to another bridge (i.e. it is served by a point-to-point LAN segment), or if it can be connected to two or more bridges (i.e. it is served by a shared-medium LAN segment). This function allows link status of the link to be manipulated administratively. “**Auto**” means to auto select P2P or Share mode. “**P2P**” means P2P is enabled, the 2 ends work in Full duplex mode. While “**Share**” is enabled, it means P2P is disabled, the 2 ends may connect through a share media and work in Half duplex mode.

Edge: A port directly connected to the end stations cannot create a bridging loop in the network. To configure this port as an edge port, set the port to the **Enable** state. When the non-bridge device connects an admin edge port, this port will be in blocking state and turn to forwarding state in 4 seconds.

Once you finish your configuration, click on **Apply** to save your settings.

4.4.3 RSTP Info

This page allows you to see the information of the root switch and port status.

RSTP Information

Root Information

Bridge ID	8000.0012.7760.1455
Root Priority	32768
Root Port	N/A
Root Path Cost	0
Max Age(6-40)	20 sec
Hello Time(1-10)	2 sec
Forward Delay(4-30)	15 sec

Port Information

Port	Role	Port State	Path Cost	Port Priority	Oper P2P	Oper Edge
1	--	Disabled	200000	128	P2P	Edge
2	--	Disabled	200000	128	Shared	Edge
3	Designated	Forwarding	200000	128	P2P	Non-Edge
4	--	Disabled	200000	128	Shared	Edge
5	--	Disabled	200000	128	Shared	Edge

Root Information: You can see root Bridge ID, Root Priority, Root Port, Root Path Cost and the Max Age, Hello Time and Forward Delay of BPDU sent from the root switch.

Port Information: You can see port Role, Port State, Path Cost, Port Priority, Oper P2P mode, Oper edge port mode and Aggregated (ID/Type).

4.4.4 MSTP (Multiple Spanning Tree Protocol) Configuration

MSTP is the abbreviation of Multiple Spanning Tree Protocol. This protocol is a direct extension of RSTP. It can provide an independent spanning tree for different VLANs. It simplifies network management, provides for even faster convergence than RSTP by limiting the size of each region, and prevents VLAN members from being segmented from the rest of the group (as sometimes occurs with IEEE 802.1D STP).

While using MSTP, there are some new concepts of network architecture. A switch may belong to different group, acts as root or designate switch, generate BPDU for the network to maintain the forwarding table of the spanning tree. With MSTP, it can also provide multiple forwarding paths and enable load balancing. Understand the architecture allows you to maintain the correct spanning tree and operate effectively.

One VLAN can be mapped to a Multiple Spanning Tree Instance (MSTI). The maximum Instance of JetNet 4508 supports is 16, range from 0-15. The MSTP builds a separate Multiple Spanning Tree (MST) for each instance to maintain connectivity among each of the assigned VLAN groups. An Internal Spanning Tree (IST) is used to connect all the MSTP switches within an MST region. An MST Region may contain multiple MSTP Instances.

The figure shows there are 2 VLANs/MSTP Instances and each instance has its Root and forwarding paths.

A Common Spanning Tree (CST) interconnects all adjacent MST regions and acts as a virtual bridge node for communications with STP or RSTP nodes in the global network. MSTP connects all bridges and LAN segments with a single Common and Internal Spanning Tree (CIST). The CIST is formed as a result of the running spanning tree algorithm between switches that support the STP, RSTP, MSTP protocols.

The figure shows the CST large network. In this network, a Region may have different instances and its own forwarding path and table; however, it

acts as a single Brige of CST.

To configure the MSTP setting, the STP Mode of the STP Configuration page should be changed to MSTP mode first.

STP Configuration

STP Mode

Bridge Configuration

Bridge Address	0012.7760.46b6
Bridge Priority	32768 ▼
Max Age	20 ▼
Hello Time	2 ▼
Forward Delay	15 ▼

After enabled MSTP mode, then you can go to the MSTP Configuraiton pages.

MSTP Region Configuration

This page allows configure the Region Name and its Revision, mapping the VLAN to Instance and check current MST Instance configuration. The network can be divided virtually to different Regions. The switches within the Region should have the same Region and Revision leve.

Region Name: The name for the Region. Maximum length: 32 characters.

Revision: The revision for the Region. Range: 0-65535; Default: 0)

Once you finish your configuration, click on **Apply** to apply your settings.

New MST Instance

This page allows mapping the VLAN to Instance and assign priority to the instance. Before mapping VLAN to Instance, you should create VLAN and assign the member ports first. Please refer to the VLAN setting page.

MSTP Configuration

MST Region Configuration

Region Name	Korenix
Revision	0

Apply

New MST Instance

Instance ID	1
VLAN Group	
Instance Priority	32768

Add

Instance ID: Select the Instance ID, the available number is 1-15.
VLAN Group: Type the VLAN ID you want mapping to the instance.
Instance Priority: Assign the priority to the instance.
After finish your configuration, click on **Add** to apply your settings.

Current MST Instance Configuration

This page allows you to see the current MST Instance Configuration you added. Click on “**Apply**” to apply the setting. You can “**Remove**” the instance or “**Reload**” the configuration display in this page.

Current MST Instance Configuration

Instance ID	VLAN Group	Instance Priority
1	2	32768
2	3	32768

Apply **Remove** **Reload**

4.4.5 MSTP Port Configuration

This page allows configure the Port settings. Choose the Instance ID you want to configure. The MSTP enabled and linked up ports within the instance will be listed in this table.

Note that the ports not belonged to the Instance, or the ports not MSTP activated will not display. The meaning of the Path Cost, Priority, Link Type and Edge Port is the same as the definition of RSTP.

MSTP Port Configuration

Instance ID

Port	Path Cost	Priority	Link Type	Edge Port
1	200000	128	Auto	Enable
2	200000	128	Auto	Enable

Path Cost: Enter a number between 1 and 200,000,000. This value represents the “cost” of the path to the other bridge from the transmitting bridge at the specified port.

Priority: Enter a value between 0 and 240, using multiples of 16. This is the value that decides which port should be blocked by priority in a LAN.

Link Type: There are 3 types for you select. **Auto**, **P2P** and **Share**.

Some of the rapid state transitions that are possible within RSTP depend upon whether the port of concern can only be connected to another bridge (i.e. it is served by a point-to-point LAN segment), or if it can be connected to two or more bridges (i.e. it is served by a shared-medium LAN segment). This function allows link status of the link to be manipulated administratively. “**Auto**” means to auto select P2P or Share mode. “**P2P**” means P2P is enabled; the 2 ends work in full duplex mode. While “**Share**” is enabled, it means P2P is disabled; the 2 ends may connect through a share media and work in half duplex mode.

Edge: A port directly connected to the end stations cannot create a bridging loop in the network. To configure this port as an edge port, set the port to the **Enable** state. When the non-bridge device connects an admin edge port, this port will be in blocking state and turn to forwarding state in 4 seconds.

Once you finish your configuration, click on **Apply** to save your settings.

4.4.6 MSTP Information

This page allows you to see the current MSTP information.

Choose the **Instance ID** first. If the instance is not added, the information remains blank.

The **Root Information** shows the setting of the Root switch.

The **Port Information** shows the port setting and status of the ports within the instance.

MSTP Information

Instance ID

Root Information

Root Address	0012.7760.ad4b
Root Priority	4096
Root Port	N/A
Root Path Cost	0
Max Age	20 second(s)
Hello Time	2 second(s)
Forward Delay	15 second(s)

Port Information

Port	Role	Port State	Path Cost	Port Priority	Link Type	Edge Port
5	Designated	Forwarding	200000	128	P2P Internal(MSTP)	Non-Edge
6	Designated	Forwarding	200000	128	P2P Internal(MSTP)	Non-Edge

Click "**Reload**" to reload the MSTP information display.

4.4.7 Multiple Super Ring (MSR) (The same as 4.4.31 of previous version manual.)

The most common industrial network redundancy is to form a ring or loop. Typically, the managed switches are connected in series and the last switch is connected back to the first one. In such connection, you can implement Korenix Multiple Super Ring technology to get fastest recovery performance.

Multiple Super Ring (MSR) technology is *Korenix's* 3rd generation Ring redundancy technology. This is patented and protected by *Korenix* and is used in countries all over the world. MSR ranks the fastest restore and failover time in the world, 0 ms for restore and about milliseconds level for failover for 100Base-TX copper port. The other interface may take longer time due to the media characteristics.

Advanced **Rapid Dual Homing (RDH)** technology also facilitates *JetNet Managed Switch* to connect with a core managed switch easily and conveniently. With RDH technology, you can also couple several Rapid Super Rings or RSTP cloud together, which is also known as Auto Ring Coupling.

TrunkRing technology allows integrate MSR with LACP/Port Trunking. The LACP/Trunk aggregated ports is a virtual interface and it can work as the Ring port of the MSR.

MultiRing is an outstanding technology Korenix can support. Multiple rings can be aggregated within one switch by using different Ring ID. The maximum Ring number one switch can support is half of total port volume. For example, the JetNet 4508 series are 8-port Fast Ethernet Switch design, which means maximum supports 4 Rings (4 100Mbps Rings) can be aggregated in one JetNet 4508 Switch. The feature saves much effort when constructing complex network architecture.

New Ring: To create a Rapid Super Ring. Just fill in the Ring ID which has range from 0 to 31. If the name field is left blank, the name of this ring will be automatically naming with Ring ID.

New Ring

Ring ID	Name
1	

Add

Ring Configuration

ID	Name	Version	Device Priority	Ring Port1	Path Cost	Ring Port2	Path Cost	Dual Homing II	Ring Status
1	Ring1	Rapid Super R	128	Port 1	128	Port 2	128	Disable	Enable

Ring Configuration

ID: Once a Ring is created, This appears and can not be changed.

Name: This field will show the name of the Ring. If it is not filled in when creating, it will be automatically named by the rule “RingID”.

Version: The version of Ring can be changed here. There are three modes to choose: Rapid Super Ring as default; Super ring for compatible with Korenix 1st general ring and Any Ring for compatible with other version of rings.

Device Priority: The switch with highest priority (highest value) will be automatically selected as Ring Master. Then one of the ring ports in this switch will become forwarding port and the other one will become blocking port. If all of the switches have the same priority, the switch with the biggest MAC address will be selected as Ring Master.

Ring Port1: In Rapid Super Ring environment, you should have 2 Ring Ports. No matter this switch is Ring Master or not, when configuring RSR, 2 ports should be selected to be Ring Ports. For Ring Master, one of the ring ports will become the forwarding port and the other one will become the blocking port.

Path Cost: Change the Path Cost of Ring Port1. If this switch is the Ring Master of a Ring, then it determines the blocking port. The Port with higher Path Cost in the two ring ports will become the blocking port, If the Path Cost is the same, the port with larger port number will become the blocking port.

Ring Port2: Assign another port for ring connection

Path Cost: Change the Path Cost of Ring Port2

Rapid Dual Homing: Rapid Dual Homing is an important feature of Korenix 3rd generation Ring redundancy technology. When you want to connect multiple RSR or form redundant topology with other vendors, RDH could allow you to have maximum 7 multiple links for redundancy without any problem.

In Dual Homing I released with JetNet 4000/4500 series, you have to configure additional port as Dual Homing port to two uplink switches. In Rapid Dual Homing, you don't need to configure specific port to connect to other protocol. The Rapid

Dual Homing will smartly choose the fastest link for primary link and block all the other link to avoid loop. If the primary link failed, Rapid Dual Homing will automatically forward the secondary link for network redundant. Of course, if there are more connections, they will be standby links and recover one of them if both primary and secondary links are broken.

Ring status: To enable/disable the Ring. Please remember to enable the ring after you add it.

MultiRing: The MultiRing technology is one of the patterns of the MSR technology; it allows you to aggregate multiple rings within one switch. Create multiple ring ID and assign different ring port 1 and port 2 to each ring, thus the switch can have multiple rings in one JetNet Switch.

When implementing MultiRing, remember that the different rings can NOT use the same ring ID. The other settings are the same as above description. Technically, the maximum ring volume the MultiRing supported is up to 16 rings. Due the limited number of ports, the number of ring network is the half of port number.

TrunkRing: The MultiRing technology is part of the MSR technology which combines the MSR with the port trunking technology. After multiple ports aggregated, this is so-call port trunking (Statically or learnt by LACP protocol), the Trunk ID can be one of the port ID of the MSR technology. Configured the port trunking first then you can add the Trunk group as a Ring Port in managed switch.

4.4.8 Ring Info (The same as 4.4.4 of previous version manual.)

This page shows the RSR information.

Multiple Super Ring Information							
ID	Version	Role	Status	RM MAC	Blocking Port	Role Transition Count	Ring State Transition Count
1	Rapid Super Ring	nonRM	Normal	0012.7760.b15b	Port2	13	29

ID: Ring ID.

Version: which version of this ring, this field could be Rapid Super Ring, Super Ring, or Any Ring

Role: This Switch is RM or nonRM

Status: If this field is Normal which means the redundancy is approved. If any one of the link in this Ring is broken, then the status will be Abnormal.

RM MAC: The MAC address of Ring Master of this Ring. It helps to find the redundant path.

Blocking Port: This field shows which is blocked port of RM.

Role Transition Count: This means how many times this switch has changed its Role from nonRM to RM or from RM to nonRM.

Ring state Transition Count: This number means how many times the Ring status has been transformed between Normal and Abnormal state.

4.5 VLAN

A Virtual LAN (VLAN) is a “logical” grouping of nodes for the purpose of limiting a broadcast domain to specific members of a group without physically grouping the members together. That means, VLAN allows you to isolate network traffic so that only members of VLAN could receive traffic from the same VLAN members. Basically, creating a VLAN from a switch is the logical equivalent of physically reconnecting a group of network devices to another Layer 2 switch, without actually disconnecting these devices from their original switches.

The 8-port Industrial Ethernet Switch supports 802.1Q VLAN. 802.1Q VLAN is also known as Tag-Based VLAN. This Tag-Based VLAN allows VLAN to be created across different switches (see Figure 1). IEEE 802.1Q tag-based VLAN makes use of VLAN control information stored in a VLAN header attached to IEEE 802.3 packet frames. This tag contains a VLAN Identifier (VID) that indicates which VLAN a frame belongs to. Since each switch only has to check a frame’s tag, without the need to dissect the contents of the frame, this also saves a lot of computing resources within the switch.

Figure 4.5-1 802.1Q VLAN

VLAN Configuration group enables you to Add/Remove VLAN, configure port Ingress/Egress parameters and view VLAN table.

Following commands are included in this group:

- 4.5.1 VLAN Port Configuration
- 4.5.2 VLAN Configuration
- 4.5.3 GVRP Configuration
- 4.5.4 VLAN Table
- 4.5.5 CLI Commands of the VLAN

4.5.1 VLAN Port Configuration

VLAN Port Configuration allows you to set up VLAN port parameters to specific port. These parameters include PVID, Accept Frame Type and Ingress Filtering.

Figure 4.5-2 Web UI of VLAN configuration.

Port	PVID	Accept Frame Type	Ingress Filtering
1	1	Admit All	Disable
2	1	Admit All	Disable
3	1	Admit All	Disable
4	1	Admit All	Disable
5	1	Admit All	Disable
6	1	Admit All	Disable
7	1	Admit All	Disable
8	1	Admit All	Disable
9	1	Admit All	Disable

Apply

PVID: The abbreviation of the **Port VLAN ID**. Enter port VLAN ID here. PVID allows the switches to identify which port belongs to which VLAN. To keep things simple, it is recommended that PVID is equivalent to VLAN IDs.

The values of PVIDs are from 0 to 4095. But, 0 and 4095 are reserved. You can't input these 2 PVIDs. 1 is the default value. 2 to 4094 are valid and available in this column. Type the PVID you'd like to configure here.

Accept Frame Type: This column defines the accepted frame type of the port. There are 2 modes you can select, **Admit All** and **Tag Only**. Admit All

mode means that the port can accept both tagged and untagged packets. Tag Only mode means that the port can only accept tagged packets.

Ingress Filtering: Ingress filtering helps VLAN engine to filter out undesired traffic on a port. When Ingress Filtering is enabled, the port checks whether the incoming frames belong to the VLAN they claimed or not. Then the port determines if the frames can be processed or not. For example, if a tagged frame from Engineer VLAN is received, and Ingress Filtering is enabled, the switch will determine if the port is on the Engineer VLAN's Egress list. If it is, the frame can be processed. If it's not, the frame would be dropped.

4.5.2 VLAN Configuration

In this page, you can assign Management VLAN, create the static VLAN, and assign the Egress rule for the member ports of the VLAN.

Figure 4.5-3 Web UI of the VLAN Configuration.

Management VLAN ID

Static VLAN

VLAN ID	Name
<input type="text"/>	<input type="text"/>

Sample of JetNet 5010G

Static VLAN Configuration

VLAN ID	Name	1	2	3	4	5	6	7	8	9	10
1	VLAN1	U	U	U	U	U	U	U	U	U	U

Management VLAN ID: The switch supports management VLAN. The management VLAN ID is the VLAN ID of the CPU interface so that only member ports of the management VLAN can ping and access the switch. The default management VLAN ID is 1.

Static VLAN: You can assign a VLAN ID and VLAN Name for new VLAN here.

VLAN ID is used by the switch to identify different VLANs. Valid VLAN ID is between 1 and 4094. 1 is the default VLAN.

VLAN Name is a reference for network administrator to identify different VLANs. The available character is 12 for you to input. If you don't input VLAN name, the system will automatically assign VLAN name for the VLAN. The rule is VLAN (VLAN ID).

Static VLAN

VLAN ID	NAME
3	test

Figure 4.5-4 The steps to create a new VLAN: Type VLAN ID and NAME, and press **Add** to create a new VLAN. Then you can see the new VLAN in the Static VLAN Configuration table. Refer to Figure 4.5-5

After created the VLAN, the status of the VLAN will remain in Unused until you add ports to the VLAN.

Note: Before you change the management VLAN ID by Web and Telnet, remember that the port attached by the administrator should be the member port of the management VLAN; otherwise the administrator can't access the switch via the network.

Note: Currently the 8-port Switch only support max 256 groups VLAN.

Static VLAN Configuration

You can see the created VLANs and specify the egress (outgoing) port rule to be **Untagged or Tagged** here.

Figure 4.5-5 below shows the Static VLAN Configuration table. You can see that new VLAN 3 (test) is created and the Egress rules of the ports are not configured now.

Static VLAN Configuration

VLAN ID	NAME	1	2	3	4	5	6	7	8	9	10
1	VLAN1	U	U	U	U	U	U	U	U	U	U
2	VLAN2	--	--	--	--	--	--	--	--	--	--
3	test	--	--	--	--	--	--	--	--	--	--

Figure 4.5.2.4 Configure Egress rule of the ports.

Static VLAN Configuration

VLAN ID	NAME	1	2	3	4	5	6	7	8	9	10
1	VLAN1	U	U	U	U	U	U	U	U	U	U
2	VLAN2	U	U	U	U	--	--	--	--	--	--
3	test	--	--	--	--	U	T	▼	T	T	T

--
U
T

Apply
Remove
Reload

Sample of JetNet 5010G

-- : Not available

U: Untag: Indicates that egress/outgoing frames are not VLAN tagged.

T : Tag: Indicates that egress/outgoing frames are to be VLAN tagged.

Steps to configure Egress rules: Select the VLAN ID. Entry of the selected VLAN turns to light blue. Assign Egress rule of the ports to **U** or **T**. Press **Apply** to apply the setting. If you want to remove one VLAN, select the VLAN entry. Then press **Remove** button.

4.5.3 GVRP configuration

GVRP allows users to set-up VLANs automatically rather than manual configuration on every port of every switch in the network.

GVRP Configuration

GVRP Protocol Enable ▼

Port	State	Join Timer	Leave Timer	Leave All Timer
1	Enable	20	60	1000
2	Enable	20	60	1000
3	Enable	20	60	1000
4	Enable	20	60	1000
5	Enable	20	60	1000
6	Enable	20	60	1000
7	Enable	20	60	1000
8	Enable	20	60	1000
9	Enable	20	60	1000

Note: Timer unit is centiseconds.

Apply

Sample of JetNet 5010G

GVRP Protocol: Allow user to enable/disable GVRP globally.

State: After enable GVRP globally, here still can enable/disable GVRP by port.

Join Timer: Controls the interval of sending the GVRP Join BPDU. An instance of this timer is required on a per-Port, per-GARP Participant basis

Leave Timer: Control the time to release the GVRP reservation after received the GVRP Leave BPDU. An instance of the timer is required for each state machine that is in the LV state

Leave All Timer: Controls the period to initiate the garbage collection of registered VLAN. The timer is required on a per-Port, per-GARP Participant basis

4.5.4 VLAN Table

This table shows you current settings of your VLAN table, including VLAN ID, Name, Status, and Egress rule of the ports.

Your Industrial Computing & Networking Partner

VLAN Table

VLAN Table

VLAN ID	Name	Status	1	2	3	4	5	6	7	8	9	10
1	VLAN1	Static	U	U	U	U	U	U	U	U	U	U

3	test	Static	--	--	U	U	--	T	T	T	--	--

Sample of JetNet 5010G

Reload

VLAN ID: ID of the VLAN.

Name: Name of the VLAN.

Status: **Static** shows this is a manually configured static VLAN. **Unused** means this VLAN is created by UI/CLI and has no member ports. This VLAN is not workable yet. **Dynamic** means this VLAN is learnt by GVRP.

After created the VLAN, the status of this VLAN will remain in Unused status until you add ports to the VLAN.

4.6 Private VLAN

The private VLAN helps to resolve the primary VLAN ID shortage, client ports isolation and network security issues. The Private VLAN provides primary and secondary VLAN within a single switch.

Primary VLAN: The uplink port is usually the primary VLAN. A primary VLAN contains promiscuous ports that can communicate with lower Secondary VLANs.

Secondary VLAN: The client ports are usually defined within secondary VLAN. The secondary VLAN includes Isolated VLAN and Community VLAN. The client ports can be isolated VLANs or can be grouped in the same Community VLAN. The ports within the same community VLAN can communicate with each other. However, the isolated VLAN ports can Not.

The figure shows the typical Private VLAN network. The SCADA/Public Server or NMS workstation is usually located in primary VLAN. The clients PCs or Rings are located within Secondary.

Private VLAN (PVLAN) Configuration group enables you to Configure PVLAN, PVLAN Port and see the PVLAN Information.

Following commands are included in this group:

- 4.6.1 PVLAN Configuration
- 4.6.2 PVLAN Port Configuration
- 4.6.3 CLI Commands of the PVLAN

4.6.1 PVLAN Configuration

PVLAN Configuration allows you to assign Private VLAN type. After created VLAN in VLAN Configuraiton page, the available VLAN ID will display here. Choose the Private VLAN types for each VLAN you want configure.

None: The VLAN is Not included in Private VLAN.

Primary: The VLAN is the Primary VLAN. The member ports can communicate with secondary ports.

Isolated: The VLAN is the Isolated VLAN. The member ports of the VLAN are isolated.

Community: The VLAN is the Community VLAN. The member ports of the VLAN can communicate with each other.

Private VLAN Configuration

Private VLAN Configuration

VLAN ID	Private VLAN Type
2	Primary
3	Isolated
4	Community
5	Isolated

None
Primary
Isolated
Community

Apply

4.6.2 PVLAN Port Configuration

PVLAN Port Configuration page allows configure Port Configuration and Private VLAN Association.

Private VLAN Association

Secondary VLAN: After the Isolated and Community VLAN Type is assigned in Private VLAN Configuration page, the VLANs are belonged to the Secondary VLAN and displayed here.

Primary VLAN: After the Primary VLAN Type is assigned in Private VLAN Configuration page, the secondary VLAN can associate to the Primary VLAN ID. Select the Primary VLAN ID here.

Note: Before configuring PVLAN port type, the Private VLAN Association should be done first.

Port Configuraion

PVLAN Port Type :

Normal: The Normal port is None PVLAN ports, it remains its original VLAN setting.

Host: The Host type ports can be mapped to the Secondary VLAN.

Promiscuous: The promiscuous port can be associated to the Primary VLAN.

VLAN ID: After assigned the port type, the web UI display the available VLAN ID the port can associate to.

For example:

1. VLAN Create: VLAN 2-5 are created in VLAN Configuration page.

2. Private VLAN Type: VLAN 2-5 has its Private VLAN Type configured in Private VLAN Configuration page.

VLAN 2 is belonged to Primary VLAN.

VLAN 3-5 are belonged to secondary VLAN (Isolated or Community).

3. Private VLAN Association: Associate VLAN 3-5 to VLAN 2 in Private VLAN Association first.

4. Private VLAN Port Configuraiton

VLAN 2 – Primary -> The member port of VLAN 2 is promiscuous port.

VLAN 3 – Isolated -> The Host port can be mapped to VLAN 3.

VLAN 4 – Community -> The Host port can be mapped to VLAN 3.

VLAN 5 – Community -> The Host port can be mapped to VLAN 3.

5. Result:

VLAN 2 -> VLAN 3, 4, 5; member ports can communicate with ports in secondary VLAN.

VLAN 3 -> VLAN 2, member ports are isolated, but it can communicate with member port of VLAN 2..

VLAN 4 -> VLAN 2, member ports within the community can communicate with each other and communicate with member port of VLAN 2.

VLAN 5 -> VLAN 2, member ports within the community can communicate with each other and communicate with member port of VLAN 2.

Private VLAN Port Configuration

Port Configuration

Port	PVLAN Port Type	VLAN ID
1	Normal	None
2	Normal	None
3	Normal	None
4	Normal	None
5	Normal	None
6	Normal	None
7	Host	5
8	Host	4
9	Host	3
10	Promiscuous	2

Apply

Private VLAN Association

Secondary VLAN	Primary VLAN
3	2
4	2
5	2

4.6.3 Private VLAN Information

This page allows you to see the Private VLAN information.

Private VLAN Information

Private VLAN Information

Primary VLAN	Secondary VLAN	Secondary VLAN Type	Ports
2	3	Isolated	10,9
2	4	Community	10,8
2	5	Community	10,7

4.7 Traffic Prioritization

Quality of Service (QoS) provides traffic prioritization mechanism which allows users to deliver better service to certain flows. QoS can also help to alleviate congestion problems and ensure high-priority traffic is delivered first. This section allows you to configure Traffic Prioritization settings for each port with regard to setting priorities.

JetNet switch's QoS supports 4 physical queues, weighted fair queuing (WRR) and Strict Priority scheme, which follows 802.1p COS tag and IPv4 TOS/DiffServ information to prioritize the traffic of your industrial network.

Following commands are included in this group:

4.7.1 QoS Setting

4.7.2 CoS-Queue Mapping

4.7.3 DSCP-Queue Mapping

4.7.4 CLI Commands of the Traffic Prioritization

4.7.1 QoS Setting

QoS Setting

Queue Scheduling

Use an 8,4,2,1 weighted fair queuing scheme
 Use a strict priority scheme

Port Setting

Port	CoS	Trust Mode
1	0 ▼	COS Only ▼
2	1 ▼	DSCP Only ▼
3	2 ▼	COS First ▼
4	3 ▼	DSCP First ▼
5	4 ▼	COS Only ▼
6	5 ▼	COS Only ▼
7	6 ▼	COS Only ▼
8	7 ▼	COS Only ▼

COS Only
 DSCP Only
 COS First
 DSCP First

Queue Scheduling

You can select the Queue Scheduling rule as follows:

Use an 8,4,2,1 weighted fair queuing scheme. This is also known as **WRR** (Weight Round Robin). JetNet will follow 8:4:2:1 rate to process the packets in a queue from the highest priority to the lowest. For example, the system will process 8 packets with the highest priority in the queue, 4 with middle priority, and 2 with low priority and 1 with the lowest priority at the same time.

Use a strict priority scheme. Packets with higher priority in the queue will always be processed first, except that there is no packet with higher priority.

Port Setting

CoS column is to indicate default port priority value for untagged or priority-tagged frames. When JetNet receives the frames, JetNet will attach the value to the CoS field of the incoming VLAN-tagged packets. You can enable 0,1,2,3,4,5,6 or 7 to the port.

Trust Mode is to indicate Queue Mapping types for you to select.

COS Only: Port priority will only follow COS-Queue Mapping you have assigned.

DSCP Only: Port priority will only follow DSCP-Queue Mapping you have assigned.

COS first: Port priority will follow COS-Queue Mapping first, and then DSCP-Queue Mapping rule.

DSCP first: Port priority will follow DSCP-Queue Mapping first, and then COS-Queue Mapping rule.

Default priority type is **COS Only**. The system will provide default COS-Queue table to which you can refer for the next command.

After configuration, press **Apply** to enable the settings.

4.7.2 CoS-Queue Mapping

This page is to change CoS values to Physical Queue mapping table. Since the switch fabric of JetNet only supports 4 physical queues, Lowest, Low, Middle and High. Users should therefore assign how to map CoS value to the level of the physical queue.

In JetNet management switch, users can freely assign the mapping table or follow the suggestion of the 802.1p standard. Korenix uses 802.1p suggestion as default values. You can find CoS values 1 and 2 are mapped to physical Queue 0, the lowest queue. CoS values 0 and 3 are mapped to physical Queue 1, the low/normal physical queue. CoS values 4 and 5 are mapped to physical Queue 2, the middle physical queue. CoS values 6 and 7 are mapped to physical Queue 3, the high physical queue.

CoS-Queue Mapping

CoS-Queue Mapping

CoS	0	1	2	3	4	5	6	7
Queue	1 ▼	0 ▼	0 ▼	1 ▼	2 ▼	2 ▼	3 ▼	3 ▼

Note: Queue 3 is the highest priority queue.

Apply

After configuration, press **Apply** to enable the settings.

4.7.3 DSCP-Queue Mapping

This page is to change DSCP values to Physical Queue mapping table. Since the switch fabric of JetNet only supports 4 physical queues, Lowest, Low, Middle and High. Users should therefore assign how to map DSCP value to the level of the physical queue. In JetNet, users can freely change the mapping table to follow the upper layer 3 switch or routers' DSCP setting.

Traffic Prioritization

DSCP-Queue Mapping

4.8 Multicast Filtering

For multicast filtering, JetNet 4508 / 4508f use IGMP Snooping technology. IGMP (Internet Group Management Protocol) is an Internet Protocol that provides a way for internet device to report its multicast group membership to adjacent routers. Multicasting allows one computer on the internet to send data to a multitude of other computers that have identified themselves as being interested in receiving the originating computers data.

Multicasting is useful for such applications as updating the address books of mobile computer users in the field, sending out newsletters to a distribution list, and broadcasting streaming media to an audience that has tuned into the event by setting up multicast group membership.

In effect, IGMP Snooping manages multicast traffic by making use of switches, routers, and hosts that support IGMP. Enabling IGMP Snooping allows the ports to detect IGMP queries, report packets, and manage multicast traffic through the switch. IGMP has three fundamental types of messages, as shown below:

Message	Description
Query	A message sent from the querier (an IGMP router or a switch) which asks for a response from each host that belongs to the multicast group.
Report	A message sent by a host to the querier to indicate that the host wants to be or is a member of a given group indicated in the report message.
Leave Group	A message sent by a host to the querier to indicate that the host has quit as a member of a specific multicast group.

You can enable **IGMP Snooping** and **IGMP Query** functions here. You will see the information of the IGMP Snooping function in this section, including different multicast groups" VID and member ports, and IP multicast addresses that range from 224.0.0.0 to 239.255.255.255.

In this section, Force filtering can determined whether the switch flooding unknown multicast or not.

Following commands are included in this group:

4.8.1 IGMP Snooping

4.8.2 IGMP Query

4.8.3 Force Filtering

4.8.1 IGMP Snooping

This page is to enable IGMP Snooping feature, assign IGMP Snooping for specific VLAN, and view IGMP Snooping table from dynamic learnt or static manual key-in. JetNet Managed Switch support IGMP snooping V1/V2/V3 automatically and IGMP query V1/V2.

IGMP Snooping, you can select **Enable** or **Disable** here. After enabling IGMP Snooping, you can then enable IGMP Snooping for specific VLAN. You can enable IGMP Snooping for some VLANs so that some of the VLANs will support IGMP Snooping and others won't.

To assign IGMP Snooping to VLAN, please select the **checkbox** of VLAN ID or select "**Select All**" checkbox for all VLANs. Then press **Enable**. In the same way, you can also **Disable** IGMP Snooping for certain VLANs.

IGMP Snooping

IGMP Snooping

	VID	IGMP Snooping
<input checked="" type="checkbox"/>	1	Enabled
<input checked="" type="checkbox"/>	2	Enabled
<input type="checkbox"/>	3	Disabled

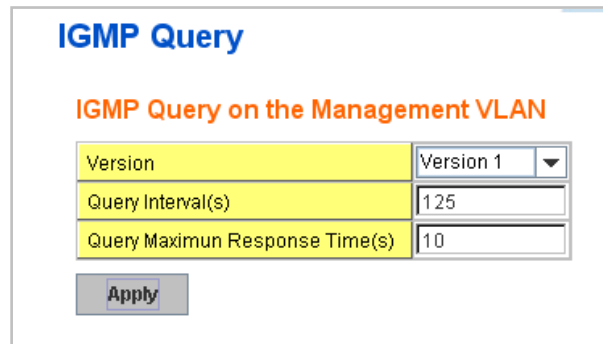

Select All

IGMP Snooping Table: In the table, you can see multicast group IP address, VLAN ID it belongs to, and member ports of the multicast group. JetNet Managed Switch supports 256 multicast groups. Click on **Reload** to refresh the table.

IGMP Snooping Table

IP Address	VID	1	2	3	4	5	6	7	8	9	10
239.255.255.250	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
239.192.8.0	1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

4.8.2 IGMP Query

IGMP Query	
IGMP Query on the Management VLAN	
Version	Version 1
Query Interval(s)	125
Query Maximum Response Time(s)	10
<input type="button" value="Apply"/>	

This page allows users to configure **IGMP Query** feature. Since JetNet Managed Switch can only be configured by member ports of the management VLAN, IGMP Query can only be enabled on the management VLAN. If you want to run IGMP Snooping feature in several VLANs, you should notice that whether each VLAN has its own IGMP Querier first.

The IGMP querier periodically sends query packets to all end-stations on the LANs or VLANs that are connected to it. For networks with more than one IGMP querier, a switch with the lowest IP address becomes the IGMP querier.

In IGMP Query selection, you can select V1, V2 or Disable. **V1** means IGMP V1 General Query and **V2** means IGMP V2 General Query.. The query will be forwarded to all multicast groups in the VLAN. **Disable** allows you to disable IGMP Query.

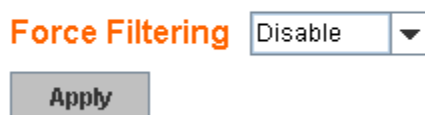

Query Interval(s): The period of query sent by querier.

Query Maximum Response Time: The span querier detect to confirm there are no more directly connected group members on a LAN.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.8.3 Force Filtering

Force Filtering

Force Filtering	Disable
<input type="button" value="Apply"/>	

The Force filtering function allows the switch to filter the unknown-multicast data flow. If Force filtering is enabled, all the unknown multicast data will be

4.9 SNMP

Simple Network Management Protocol (SNMP) is a protocol used for exchanging management information between network devices. SNMP is a member of the TCP/IP protocol suite. JetNet Managed Switch series support SNMP v1 and v2c and V3.

An SNMP managed network consists of two main components: agents and a manager. An agent is a management software module that resides in a managed switch. An agent translates the local management information from the managed device into a SNMP compatible format. The manager is the console through the network.

Following commands are included in this group:

4.9.1 SNMP Configuration

4.9.2 SNMPv3 Profile

4.9.3 SNMP Traps

4.9.4 SNMP CLI Commands for SNMP

4.9.1 SNMP Configuration

This page allows users to configure SNMP V1/V2c Community. The community string can be viewed as the password because SNMP V1/V2c doesn't request you to enter password before you try to access SNMP agent.

The community includes 2 privileges, Read Only and Read and Write.

With **Read Only** privilege, you only have the ability to read the values of MIB tables. Default community string is Public.

With **Read and Write** privilege, you have the ability to read and set the values of MIB tables. Default community string is Private.

JetNet Managed Switch allows users to assign 4 community strings. Type the community string and select the privilege. Then press **Apply**.

Note: When you first install the device in your network, we highly recommend you to change the community string. Since most SNMP management application uses Public and Private as their default community name, this might be the leakage of the network security.

SNMP V1/V2c Community

Community String	Privilege
public	Read Only ▼
private	Read and Write ▼
	Read Only ▼
	Read Only ▼

Apply

4.9.2 SNMP V3 Profile

SNMP v3 can provide more security functions when the user performs remote management through SNMP protocol. It delivers SNMP information to the administrator with user authentication; all of data between *JetNet Managed Switch* and the administrator are encrypted to ensure secure communication.

SNMP V3 Profile

SNMP V3

User Name	<input type="text"/>
Security Level	Authentication ▼
Authentication Portocol	SHA ▼
Authentication Password	<input type="text"/>
DES Encryption Password	<input type="text"/>

Add

Security Level: Here the user can select the following levels of security: None, User Authentication, and Authentication with privacy.

Authentication Protocol: Here the user can select either MD5 (Message-Digest algorithm 5) or SHA (Secure Hash Algorithm). MD5 is a widely used cryptographic hash function with a 128-bit hash value. SHA (Secure Hash Algorithm) hash functions refer to five Federal Information Processing Standard-approved algorithms for computing a condensed digital representation. *JetNet Managed Switch* provides 2 user authentication protocols in MD5 and SHA. You will need to configure SNMP v3 parameters for your SNMP viewer with the same authentication method.

Authentication Password: Here the user enters the SNMP v3 user authentication password.

DES Encryption Password: Here the user enters the password for SNMP v3 user DES Encryption.

4.9.3 SNMP Traps

SNMP Trap is the notification feature defined by SNMP protocol. All the SNMP management applications can understand such trap information. So you don't need to install new application to read the notification information.

This page allows users to **Enable SNMP Trap**, configure the **SNMP Trap server IP**, **Community** name, and trap **Version V1 or V2**. After configuration, you can see the change of the SNMP pre-defined standard traps and Korenix pre-defined traps. The pre-defined traps can be found in Korenix private MIB.

4.10 Security

JetNet 4508 V2 / 4508f V2 provides several security features for you to secure your connection. The features include Port Security and IP Security.

Following commands are included in this group:

4.10.1 Port Security

4.10.2 IP Security

4.10.3 IEEE 802.1x

4.10.4 CLI Commands of the Security

4.10.1 Port Security

Port Security feature allows you to stop the MAC address learning for specific port. After stopping MAC learning, only the MAC address listed in Port Security List can access the switch and transmit/receive traffic. This is a simple way to secure your network environment and not to be accessed by hackers.

This page allows you to enable Port Security and configure Port Security entry.

Port Security State: Change Port Security State of the port to enable first.

Add Port Security Entry: Select the port, and type VID and MAC address. Format of the MAC address is xxxx.xxxx.xxxx. Ex: 0012.7701.0101. Max volume of one port is 10. So the system can accept 100 Port Security MAC addresses in total.

Port Security List: This table shows you those enabled port security entries. You can click on **Remove** to delete the entry.

Port Security

Once you finish configuring the settings, click on **Apply / Add** to apply your configuration.

4.10.2 IP Security

In IP Security section, you can set up specific IP addresses to grant authorization for management access to this JetNet via a web browser or Telnet.

IP Security: Select Enable and **Apply** to enable IP security function.

Add Security IP: You can assign specific IP addresses, and then press **Add**. Only these IP addresses can access and manage JetNet via a web browser or Telnet. Max security IP is 10.

Security IP List: This table shows you added security IP addresses. You can press **Remove** to delete, **Reload** to reload the table.

Apply

Port control: Force Authorized means this port is authorized; the data is free to in/out. Force unauthorized just opposite, the port is blocked. If users want to control this port with Radius Server, please select Auto for port control.

Reauthentication: If enable this field, switch will ask client to re-authenticate. The default time interval is 3600 seconds.

Max Request: the maximum times that the switch allow client request.

Guest VLAN: 0 to 4094 is available for this field. If this field is set to 0, that means the port is blocked after authentication fail. Otherwise, the port will be set to Guest VLAN.

Host Mode: if there are more than one device connected to this port, set the Host Mode to single means only the first PC authenticate success can access this port. If this port is set to multi, all the devices can access this port once any one of them pass the authentication.

Control Direction: determined devices can end data out only or both send and receive.

Re-Auth Period: control the Re-authentication time interval, available number is 1~65535.

Quiet Period: When authentication failed, Switch will wait for a period and try to communicate with radius server again.

Tx period: the time interval of authentication request.

Supplicant Timeout: the timeout for the client authenticating

Sever Timeout: The timeout for server response for authenticating.

Once you finish configuring the settings, click on **Apply** to apply your configuration.

Click **Initialize Selected** to set the authorize state of selected port to initialize status.

Click **Reauthenticate Selected** to send EAP Request to supplicant to request reauthentication.

Click **Default Selected** to reset the configurable 802.1x parameters of selected port to the default values.

4.10.3.3 802.1X Port Status

4.11 Warning

JetNet 4508 / 4508f provides several types of Warning features for you to remote monitor the status of end devices or the change of your network. The features include Fault Relay, System Log and SMTP E-mail Alert.

Following commands are included in this group:

- 4.11.1 Fault Relay
- 4.11.2 Event Selection
- 4.11.3 Syslog Configuration
- 4.11.4 SMTP Configuration
- 4.11.5 CLI Commands

4.11.1 Fault Relay

The Switch provides 1 alarm relay output, also known as Digital Output. The relay (DO) contact is energized from normal and will form a close circuit under system fault conditions. The fault conditions include power failure, Ethernet port link fault, Ring topology change, Ping Failure, DI state change or ping remote IP address failure.

From the firmware version 1.1a, the fault relay supports multiple event relay binding function. That means fault relay not only support one event only, it can be assigned multiple event. The condition or term described as following.

Term	condition	description
Power	Power DC1 Power DC2 Any	Detect power input status. If one of condition occurred, relay triggered.
Port Link	Port number	Monitoring port link down event
Ring	Ring failure	If ring topology changed
Ping	IP Address: remote device's IP address.	If target IP does not reply ping request, then relay active.
Ping Reset	IP address: remote device's address Reset Time: duration of output open. Hodl Time: duration of Ping hold time.	Ping target device and trigger relay to emulate power reset for remote device, if remote system crash. Note: once perform Ping reset, the relay output will form a short circuit.
Dry Output	On period: duration of relay output short (close). Off period: duration of relay output open.	Relay continuous perform On/Off behavior with different duration.

DI	DI number (JetNet 4508 supports 1 DI)	Relay trigger when DI states change to Hi or Low
-----------	--	--

The Fault relay configuration UI has shown as below:

Fault Relay

Relay 1	Status is On		
<input type="checkbox"/> Power	Power ID	Power DC1 ▼	
<input checked="" type="checkbox"/> * Port Link	Port	<input type="checkbox"/> 1 <input checked="" type="checkbox"/> 2 <input type="checkbox"/> 3 <input type="checkbox"/> 4 <input type="checkbox"/> 5 <input type="checkbox"/> 6 <input type="checkbox"/> 7 <input type="checkbox"/> 8	
<input type="checkbox"/> Ring	Ring Failure		
<input type="checkbox"/> Ping	IP Address <input type="text"/>		
<input type="checkbox"/> Ping Reset	IP Address <input type="text"/>	Reset Time(Sec) <input type="text"/>	Hold Time(Sec) <input type="text"/>
<input type="checkbox"/> Dry Output	On Period(Sec) <input type="text"/>	Off Period(Sec) <input type="text"/>	
<input type="checkbox"/> DI	DI Number	DI 1 ▼	DI State High ▼

Relay 1: Show current relay state. If the relay is triggered, the event type will be marked with the symbol- *. On the upper diagram, the replay is triggered by port event – port 2 link down.

Power: relay trigger by power down event. It can be set to monitoring power DC1, DC2 and both.

Port Link: monitoring the port link status.

Ring: monitoring the ring status.

Ping: ping predefined IP address. If the device does not reply the Ping, the relay will be triggered.

Ping Reset: the relay active as a power switch for remote device. If the relay alarm function is occupied for the Ping Reset, the other event should be disabled. It may cause the relay wrong action.

IP address: device's IP address whose power wiring is connected with relay output.

Reset Time: user defined duration of relay contact open to emulate power switch off. After the duration, the relay contact will change to close to emulate power switch on.

Hold time: user defined the booting time that device needed. After relay contact close, the Switch will start ping after count down the hold time.

Dry Output: forced the relay active as a on/off switch. This function also should not apply with other event.

On period /Off period: the duration of relay on and off. The available range of a period is 0-65535 seconds

DI: monitoring the Digital input state.

4.11.2 Event Selection

Event Types can be divided into two basic groups: System Events and Port Events. System Events are related to the overall function of the switch, whereas Port Events related to the activity of specific ports

System Event	Warning Event is sent when.....
Device Cold Start	Power is cut off and then reconnected.
Device Warm Start	Reboot the device by CLI or Web UI.
Power 1 Failure	Power 1 is failure.
Power 2 Failure	Power 2 is failure.
Authentication failure	An incorrect password, SNMP Community String is entered.
Time Synchronize Failure	Accessing to NTP Server is failure.
Fault Relay	The DO/Fault Relay is on.
Super Ring Topology Changes	Master of Super Ring has changed or backup path is activated.
DI1 Change	The Digital Input#1 status is changed.
Port Event	Warning Event is sent when.....
Link-Up	The port is connected to another device
Link-Down	The port is disconnected (e.g. the cable is pulled out, or the opposing devices turns down)
Both	The link status changed.

Your Industrial Computing & Networking Partner

- Power 1 Failure
- Power 2 Failure
- Authentication Failure
- Time Synchronize Failure
- Fault Relay
- Super Ring Topology Change
- SFP DDM Failure
- DI1 Change
- DI2 Change

Sample of JetNet 5010G

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.11.3 SysLog Configuration

System Log is useful to provide system administrator locally or remotely monitor switch events history. There are 2 System Log modes provided by Switch local mode and remote mode.

Local Mode: In this mode, the Switch will print the occurred events selected in the Event Selection page to System Log table of JetNet Managed Switch. You can monitor the system logs in [Monitor and Diag] / [Event Log] page.

Remote Mode: The remote mode is also known as Server mode in JetNet series. In this mode, you should assign the IP address of the System Log server. Switch will send the occurred events selected in Event Selection page to System Log server you assigned.

Both: Above 2 modes can be enabled at the same time.

Warning - SysLog Configuration

Syslog Mode	Both
Remote IP Address	Disable
Note: When enabled Local or Remote for the system logs in the [Monitor and Diag] / [Event Log] page.	
<input type="button" value="Apply"/>	

Once you finish configuring the settings, click on **Apply** to apply your configuration.

Note: When enabling Local or Both modes, you can monitor the system logs in [Monitor and Diag] / [Event Log] page.

4.11.4 SMTP Configuration

The Switch supports E-mail Warning feature. The switch will send the occurred events to remote E-mail server. The receiver can then receive notification by E-mail. The E-mail warning is conformed to SMTP standard.

This page allows you to enable E-mail Alert, assign the SMTP Server IP, Sender E-mail, and Receiver E-mail. If SMTP server requests you to authorize first, you can also set up the username and password in this page.

Warning - SMTP Configuration

E-mail Alert

SMTP Configuration

SMTP Server IP	192.168.10.1
Mail Account	admin@korenix.com
<input type="checkbox"/> Authentication	
User Name	
Password	
Confirm Password	
Rcpt E-mail Address 1	korecare@korenix.com
Rcpt E-mail Address 2	
Rcpt E-mail Address 3	
Rcpt E-mail Address 4	

Field	Description
SMTP Server IP Address	Enter the IP address of the email Server
Authentication	Click on check box to enable password
User Name	Enter email Account name (Max.40 characters)
Password	Enter the password of the email account
Confirm Password	Re-type the password of the email account
You can set up to 4 email addresses to receive email alarm from JetNet	
Rcpt E-mail Address 1	The first email address to receive email alert from JetNet (Max. 40 characters)
Rcpt E-mail Address 2	The second email address to receive email alert from JetNet (Max. 40 characters)
Rcpt E-mail Address 3	The third email address to receive email alert from JetNet (Max. 40 characters)
Rcpt E-mail Address 4	The fourth email address to receive email alert from JetNet (Max. 40 characters)

Once you finish configuring the settings, click on **Apply** to apply your configuration.

4.11.5 CLI Commands

Command Lines of the Warning configuration

Feature	Command Line

4.12 Monitor and Diag

The Switch provides several types of features for you to monitor the status of the switch or diagnostic for you to check the problem when encountering problems related to the switch. The features include MAC Address Table, Port Statistics, Port Mirror, Event Log and Ping.

Following commands are included in this group:

4.12.1 MAC Address Table

4.12.2 Port Statistics

4.12.3 Port Mirror

4.12.4 Event Log

4.12.5 Topology Discovery

4.12.5 Ping

4.12.6 CLI Commands of the Monitor and Diag

4.12.1 MAC Address Table

The Switch system provides 8K entries in MAC Address Table. In this page, users can change the Aging time, add Static Unicast MAC Address, monitor the MAC address or sort them by different packet types and ports. Click on **Apply** to change the value.

Aging Time (Sec)

Each switch fabric has limit size to write the learnt MAC address. To save more entries for new MAC address, the switch fabric will age out non-used MAC address entry per Aging Time timeout. The default Aging Time is 300 seconds. The Aging Time can be modified in this page.

Static Unicast MAC Address

In some applications, users may need to type in the static Unicast MAC address to its MAC address table. In this page, you can type MAC Address (format: xxxx.xxxx.xxxx), select its VID and Port ID, and then click on **Add** to add it to MAC Address table.

MAC Address Table

In this MAC Address Table, you can see all the MAC Addresses learnt by the switch fabric. The packet types include Management Unicast, Static Unicast, Dynamic Unicast, Static Multicast and Dynamic Multicast. The table allows users to sort the address by the packet types and port.

Packet Types: Management Unicast means MAC address of the switch. It belongs to CPU port only. **Static Unicast** MAC address can be added and deleted. **Dynamic Unicast** MAC is MAC address learnt by the switch Fabric. **Static Multicast** can be added by CLI and can be deleted by Web and CLI. **Dynamic Multicast** will appear after you enabled IGMP and the switch learnt IGMP report.

Click on **Remove** to remove the static Unicast/Multicast MAC address. Click on **Reload** to refresh the table. New learnt Unicast/Multicast MAC address will be updated to MAC address table.

MAC Address Table

Aging Time (Sec)

Reload

(Sample of JetNet 5010G)

4.12.2 Port Statistics

In this page, you can view operation statistics for each port. The statistics that can be viewed include Link Type, Link State, Rx Good, Rx Bad, Rx Abort, Tx Good, Tx Bad and Collision. Rx means the received packet while Tx means the transmitted packets.

Note: If you see many Bad, Abort or Collision counts increased, that may mean your network cable is not connected well, the network performance of the port is poor...etc. Please check your network cable, Network Interface Card of the connected device, the network application, or reallocate the network traffic...etc.

Click on **Clear Selected** to reinitialize the counts of the selected ports, and **Clear All** to reinitialize the counts of all ports. Click on **Reload** to refresh the counts.

Port	Type	Link	State	Rx Good	Rx Bad	Rx Abort	Tx Good	Tx Bad	Collision
1	100TX	Down	Enable	0	0	0	0	0	0
2	100TX	Down	Enable	10	0	0	11	0	0
3	100TX	Down	Enable	0	0	0	0	0	0
4	100TX	Up	Enable	2131	0	0	2452	0	0
5	100TX	Down	Enable	0	0	0	0	0	0
6	100TX	Down	Enable	4884	1	2	5919	0	0
7	100TX	Up	Enable	54	0	0	2742	0	0
8	1000TX	Down	Enable	0	0	0	0	0	0
9	1000TX	Down	Enable	0	0	0	0	0	0
10	1000TX	Down	Enable	0	0	0	0	0	0

(sample of JetNet 5010G)

4.12.3 Port Mirroring

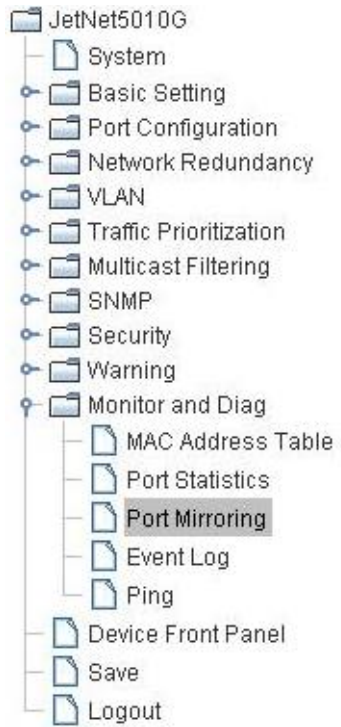

Port mirroring (also called port spanning) is a tool that allows you to mirror the traffic from one or more ports onto another port, without disrupting the flow of traffic on the original port. Any traffic that goes into or out of the Source Port(s) will be duplicated at the Destination Port. This traffic can then be analyzed at the Destination port using a monitoring device or application. A network administrator will typically utilize this tool for diagnostics, debugging, or fending off attacks.

Port Mirror Mode: Select Enable/Disable to enable/disable Port Mirror.

Source Port: This is also known as Monitor Port. These are the ports you want to monitor. The traffic of all source/monitor ports will be copied to destination/analysis ports. You can choose a single port, or any combination of ports, but you can only monitor them in Rx or TX only. Click on checkbox of the Port ID, RX, Tx or Both to select the source ports.

Destination Port: This is also known as Analysis Port. You can analyze the traffic of all the monitored ports at this port without affecting the flow of traffic on the port(s) being monitored. Only one RX/TX of the destination port can be selected. A network administrator would typically connect a LAN analyzer or Netxray device to this port.

Once you finish configuring the settings, click on **Apply** to apply the settings.

Sample of JetNet 5010G

Port Mirroring

Port Mirror Mode

9	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>	<input type="radio"/>
10	<input type="checkbox"/>	<input type="checkbox"/>	<input type="radio"/>	<input type="radio"/>

4.12.4 Event Log

In the 4.10.3, we have introduced System Log feature. When System Log Local mode is selected, the Switch will record occurred events in local log table. This page shows this log table. The entry includes the index, occurred data and time and content of the events.

Click on **Clear** to clear the entries. Click on **Reload** to refresh the table.

System Event Logs

Index	Date	Time	Event Log
1	Jan 1	02:50:53	Event: Link 4 Up.
2	Jan 1	02:50:51	Event: Link 5 Down.
3	Jan 1	02:50:50	Event: Link 5 Up.
4	Jan 1	02:50:47	Event: Link 4 Down.

4.12.5 Topology Discovery

The JetNet Switch supports topology discovery or LLDP (IEEE 802.1AB Link Layer Discovery Protocol) function that can help user to discovery multi-vendor's network devices on same segment by NMS system which supports LLDP function, for example **Korenix JetView Pro iNMS**; With LLDP function, NMS can easier maintain the topology map, display port ID, port description, system description, VLAN ID... Once the link failure, the topology change events can be updated to the NMS as well. The LLDP Port State can display the neighbor ID and IP learnt from the connected devices.

Topology Discovery

LLDP Enable ▼

LLDP Configuration

LLDP timer	5
LLDP hold time	10

LLDP Port State

Local Port	Neighbor ID	Neighbor IP	Neighbor VID
fa5	00:12:77:ff:24:13	192.168.10.3	1
fa6	00:12:77:ff:24:13	192.168.10.3	1

Apply

LLDP: Select Enable/Disable to enable/disable LLDP function.

LLDP Configuration: To configure the related timer of LLDP.

LLDP Timer: the interval time of each LLDP and counts in second; the valid number is from 5 to 254, default is 30 seconds.

LLDP Hold time: The TTL (Time To Live) timer. The LLDP state will be

expired once the LLDP is not received by the hold time. The default is 120 seconds.

Local port: the current port number that linked with neighbor network device.

Neighbor ID: the MAC address of neighbor device on the same network segment.

Neighbor IP: the IP address of neighbor device on the same network segment.

Neighbor VID: the VLAN ID of neighbor device on the same network segment.

4.12.6 Ping Utility

This page provides **Ping Utility** for users to ping remote device and check whether the device is alive or not. Type **Target IP** address of the target device and click on **Start** to start the ping. After few seconds, you can see the result in the **Result** field.

Ping Utility

4.13 Device Front Panel

Device Front Panel command allows you to see LED status of the switch. You can see LED and link status of the Power, DO, DI, R.M. and Ports.

Feature	Status
Power	On: the DC power is on applying
Digital Output	On: Dry Relay Output activated and the contact is formed a close circuit.
Digital Input	On: Digital Input is triggered to "High" level.
R.M.(Ring Master)	Green on: Ring status normal. Yellow (Amber)on: Ring is abnormal
Fast Ethernet	Green on: Port is link up.
Sys	Green on: the system is ready for working.

Note: No CLI command for this feature.

4.14 Save to Flash

Save Configuration allows you to save any configuration you just made to the Flash. Powering off the switch without clicking on **Save Configuration** will cause loss of new settings. After selecting **Save Configuration**, click on **Save to Flash** to save your new configuration.

Command Lines:

Feature	Command Line
Save	SWITCH# write Building Configuration... [OK] Switch# copy running-config startup-config Building Configuration... [OK]

4.15 Logout

The switch provides 2 logout methods. The web connection will be logged out if you don't input any command after 30 seconds. The Logout command allows you to manually logout the web connection. Click on **Yes** to logout, **No** to go back the configuration page.

Command Lines:

Feature	Command Line
Logout	SWITCH> exit
	SWITCH# exit

5 Appendix

5.1 Product Specifications – JetNet 4508 /JetNet 4508f

Technology

Standard	IEEE 802.3 10Base-T Ethernet
	IEEE 802.3u 100Base-TX Fast Ethernet
	IEEE 802.3u 100Base-FX Fast Ethernet (JetNet 4508f V2)
	IEEE 802.3x Flow Control and Back-pressure
	IEEE 802.1AB Link Layer Discovery Protocol (LLDP)
	IEEE 802.1p Class of Service (CoS)
	IEEE 802.1Q VLAN and GVRP
	IEEE 802.1Q-in-Q and Private VLAN
	IEEE 802.1D-2004 Rapid Spanning Tree Protocol (RSTP)
	IEEE 802.1s Multiple Spanning Tree Protocol (MSTP)
	IEEE 802.3ad Link Aggregation Protocol (LACP)
	IEEE 802.1x Port Based Network Access Protocol
	IEEE 1588 Precision Time Protocol (PTP)

System Performance

Switch Technology	Store and Forward Technology with 32Gbps Switch Fabric.
System Throughput	26 Mega packets per second, 64 bytes packet size. 14,880 PPS for 10Base-T 148,800 PPS for 100Base-TX (PPS: Packet Per Second)
CPU performance	32 bits ARM-9E running at 180 MHz and performance up to 200MIPS; Embedded hardware based watchdog timer.
System Memory	8M bytes flash ROM, 64M bytes SDRAM.
Transfer packet size	64 bytes to 1522bytes (includes 1522 bytes VLAN Tag).
MAC Address	8K MAC address table.
Packet Buffer	1M bits shared memory for packet buffer.
Transfer performance	14,880pps for Ethernet and 148,800 for Fast Ethernet
Relay Alarm	Dry Relay output with 1A /24V DC ability.
Digital Input (DI)	One Digital Input with Photo Copular isolation Digital Hi: DC 11V~30V Digital Low: DC 10V~0V

System Management

Configuration and monitoring interface	Supports 4 configuration and monitoring interfaces: RS-232 serial console, Telnet, SNMP and Web Browser interface
---	---

The RS-232 and Telnet interfaces support Cisco like instructions

System upgrade/Backup	Provides TFTP/Web interface for firmware upgrade and configuration backup, restore
Telnet & Local Console	Supports command line interface with Cisco like commands and maximum 4 sessions; the telnet interface also supports SSH
SNMP	Supports v1, v2c, V3 with SNMP trap function, trap station up to 4 and can be manually configured the trap server IP address
SNMP MIB	MIBII, Bridge MIB, Ethernet-like MIB, VLAN MIB, IGMP MIB, Korenix Private MIB
Korenix Utility	Supports JetView and JetView Pro with IEEE 802.1AB Link Layer Discovery Protocol for device finding and link topology discovery
Network Time Protocol	Supports NTP protocol with daylight saving function and localize time sync function.
Management IP Security	IP address security to prevent unauthorized access
E-mail Warning	4 receipt E-mail accounts with mail server authentication
System Log	Supports both Local or remote Server with authentication

Network Performance

IEEE 802.3x	Flow control pause frame supports on 10/100bps with Full Duplex and Back-pressure supports on 100 / 10Mbps Half Duplex only
Port Configuration	Port link Speed, Link mode, current status and enable/disable
Port Trunk	IEEE 802.3ad port aggregation and static port trunk; trunk member up to 8 ports and maximum 4 trunk groups.
VLAN	IEEE 802.1Q Tag VLAN with 256 VLAN Entries and provides 2K GVRP entries 3 VLAN link modes- Trunk, Hybrid and Link access
IEEE 802.1 Q-in-Q	Supports Double VLAN Tag function for implementing Metro Network topologies.
Private VLAN	The private VLAN supports isolated port access with the uplink port in the switch. Typically, each private VLAN contains many private ports and one given uplink port; each private port is isolated with each other and only communicates with the uplink port for the outgoing data and incoming data to provide client port isolated feature.
Class of Service	IEEE 802.1p class of service; per port 4 priority queues.
Traffic Prioritize	Supports 4 physical queues, weighted run robin queuing (WRR 8:4:2:1) and Strict Priority scheme, which follows 802.1p COS tag and IPv4 ToS/ Diffserv information to prioritize the traffic of your industrial network.

IGMP Snooping	IGMP Snooping v1/v2 /v3 for multicast filtering and IGMP Query mode; also support unknown multicasting process forwarding policies- drop, flooding and forward to router port.
Rate Control	Ingress filtering for Broadcast, Multicast, Unknown DA or all packets. Egress filtering for all packet types.
Port Mirroring	Online traffic monitoring on multiple selected ports
Port Security	Port security to assign authorized MAC to specific port
DHCP	DHCP Client, DHCP Server with IP & MAC Address binding and DHCP agent (option 82).
IEEE 802.1x with Radius Server Authentication	Port based network access control and also supports user authenticate by the radius account, password and key for the radius server authentication.

Network Redundancy

Multiple Super Ring (MSR)TM	New generation Korenix Ring Redundancy Technology, Includes Rapid Super Ring, Rapid Dual Homing, TrunkRing TM , MultiRing TM and backward compatible with legacy Super Ring TM .
Rapid Dual Homing (RDH)TM	Multiple uplink paths to one or multiple upper switch
TrunkRingTM	Integrate port aggregate function in ring path to get higher throughput ring architecture
MultiRingTM	Couple or multiple up to 16 Rapid Super Rings, JetNet 4508V2 supports up to 4 Fast Ethernet Ring in one Switch.
IEEE802.1d Rapid Spanning Tree	IEEE802.1D-2004 Rapid Spanning Tree Protocol. Compatible with Legacy Spanning Tree and IEEE 802.1w
IEEE802.1s	Supports multiple RSTP deployed in a VLAN or multiple VLANs.
Multiple Spanning Tree	IEEE802.1s MSTP, each MSTP instance can include one or more VLANs.

Interface

Enclosure Port	Fast Ethernet communication port: 8 x RJ-45 RS-232 console interface: RJ-45 connector DI/DO port: 4-pin removable terminal block Power port: 4-pin removable terminal block
Cables	10Base-T: 2-pairs UTP/STP Cat. 3, 4, 5 cable, EIA/TIA-568B 100-ohm (100m) 100 Base-TX: 2-pairs UTP/STP Cat. 5 cable, EIA/TIA-568B 100-ohm (100m) JetNet 4508f –m V2: multi-mode, 50~62.5/125um, 2KM JetNet 4508f-s V2: single mode, 8~10/125um, 30KM

Fiber port characteristics	<p>JetNet 4508f –m V2</p> <p>Wavelength:1310nm</p> <p>Tx power: -20dBm ~ -14dBm</p> <p>Rx sensitivity: -31dBm ~ 0dBm</p> <p>Link Budget: 11dB</p> <p>JetNet 4508f –s V2</p> <p>Wavelength: 1310nm</p> <p>Tx power: -15dBm ~ -8 dBm</p> <p>Rx sensitivity: -34dBm ~ 0 dBm</p> <p>Link Budget:19dB</p>
RS-232 serial interface	Supports Cisco like command line interface for out-band management

System Diagnostic LEDs

System	<p>Power status (Green): On (power is on applying)</p> <p>Digital Input (Green): On (Digital signal is detected)</p> <p>Alarm Output (Red): On (Output conductor is formed as a close circuit)</p> <p>System (Green): On (the system is ready), Blinking (system is on firmware upgrade progress)</p> <p>Ring Status (Green/Yellow): Green on (Ring status is normal), Green Blinking (wrong ring port connected), Yellow on (Ring Fail is occurred), Yellow blinking (ring path broken occurred at this switch)</p>
Ethernet port	Link (Green On) / Activity (Green Blinking)

Power Requirements

System Power	<p>Redundant power input with polarity auto reverse protection</p> <p>Input Range: DC 24V (10~60V DC)</p> <p>Power System Type: Positive or Negative power source</p>
Power Consumption	<p>JetNet 4508-V2: 9 Watts / DC 24V</p> <p>JetNet 4508f-V2: 10Watts / DC 24V</p>

Mechanical

Installation	DIN Rail Mounting or Wall Mounting
Case	Aluminum metal case with grade 31 protection
Dimension (mm)	55(W) x 149(H) x 131.2 (D) / with DIN Rail Clip
	55(W) x 149(H) x 120.6(D) / without DIN Rail Clip
Weight	<p>JetNet 4508V2:0.85kg</p> <p>JetNet 4508f-V2: 0.885Kg</p>

Environmental

Operating Temperature	-25~70°C (JetNet 4508V2), -10~70°C (JetNet 4508f V2)
------------------------------	---

-40°C ~ 75 °C (JetNet 4508-w V2/JetNet 4508f-w V2)

Operating Humidity 0% ~ 90%, non-condensing

Storage Temperature -40°C ~ 85 °C

Hi-Pot Insulation AC 1.5KV for all ports and power

Regulatory

Approvals

EMC IEC 61000-6-2, IEC 61000-6-4, EN50121-4

EMI

FCC Class A, CE/ EN55022

Radiation, Conduction

EMS

IEC 61000-4-2, IEC 61000-4-3, IEC 61000-4-4, IEC 61000-4-5, IEC 61000-4-6, IEC 61000-4-8, IEC 61000-4-9

Vibration IEC60068-2-6 ^{Note-2}

Shock IEC60068-2-27 ^{Note-2}

Free Fall IEC60068-2-32 with package ^{Note-3}

Warranty Global 5 years

Note-2: pending

Note-3: Korenix's internal testing

Note-4: For the latest version specification, please contact your sales window or distributor.

5.2 Product Specifications – JetNet 4508i /JetNet 4508if

Technology

Standard	IEEE 802.3 10Base-T Ethernet
	IEEE 802.3u 100Base-TX /100Base-FX Fast Ethernet
	IEEE 802.3x Flow Control and Back-pressure
	IEEE 802.1AB Link Layer Discovery Protocol (LLDP)
	IEEE 802.1p Class of Service (CoS)
	IEEE 802.1Q VLAN Tag, GVRP
	IEEE 802.1Q-in-Q and Private VLAN
	IEEE 802.1D-2004 Rapid Spanning Tree Protocol (RSTP)
	IEEE 802.1s Multiple Spanning Tree Protocol (MSTP)
	IEEE 802.3ad Link Aggregation Protocol (LACP)
	IEEE 802.1x Port Based Network Access Protocol
	IEEE 1588 Precision Time Protocol (PTP)
	Modbus TCP/IP
	ITU-T G.8032 ERPS

System Performance

Switch Technology	Store and Forward Technology with 32Gbps Switch Fabric.
System Throughput	26 Mega packets per second, 64 bytes packet size. 14,880 pps for 10Base-T 148,800 pps for 100Base-TX (PPS: Packet Per Second)
CPU performance	32 bits ARM-9E running at 180 Mhz and performance up to 200MIPS; Embedded hardware based watch-dog timer.
System Memory	8M bytes flash ROM, 64M bytes SDRAM.
Transfer packet size	64 bytes to 1522bytes (includes 1522 bytes VLAN Tag).
MAC Address	8K MAC address table.
Packet Buffer	1M bits shared memory for packet buffer.
Transfer performance	14,880pps for Ethernet and 148,800 for Fast Ethernet
Relay Alarm	Dry Relay output with 1A /24V DC ability. It supports multiple event reply function to alert either one of event occurred – power, port link, DI/Ring status change, Ping Reset or routing relay on/off.
Digital Input (DI)	One Digital Input with Photo Copular isolation Digital Hi: DC 11V~30V Digital Low: DC 10V~0V

System Management

Configuration and monitoring interface	Supports 4 configuration and monitoring interfaces: RS-232 serial console, Telnet, SNMP and Web Browser interface The RS-232 and Telnet interfaces support Cisco like instructions
System upgrade/Backup	Provides TFTP/Web interface for firmware upgrade and configuration backup, restore
Telnet & Local Console	Supports command line interface with Cisco like commands and maximum 4 sessions; the telnet interface also supports SSH
SNMP	Supports v1, v2c, V3 with SNMP trap function, trap station up to 4 and can be manually configured the trap server IP address
SNMP MIB	MIBII, Bridge MIB, Ethernet-like MIB, VLAN MIB, IGMP MIB, Korenix Private MIB
Korenix Utility	Supports JetView and JetView Pro with IEEE 802.1AB Link Layer Discovery Protocol for device finding and link topology discovery
Network Time Protocol	Supports NTP protocol with daylight saving function and localize time sync function.
Management IP Security	IP address security to prevent unauthorized access
E-mail Warning	4 receipt E-mail accounts with mail server authentication
System Log	Supports both Local or remote Server with authentication

Network Performance

IEEE 802.3x	Flow control pause frame supports on 10/100bps with Full Duplex and Back-pressure supports on 100 / 10Mbps Half Duplex only
Port Configuration	Port link Speed, Link mode, current status and enable/disable
Port Trunk	IEEE 802.3ad port aggregation and static port trunk; trunk member up to 4 ports and maximum 4 trunk groups.
VLAN	IEEE 802.1Q Tag VLAN with 256 VLAN Entries and provides 2K GVRP entries 3 VLAN link modes- Trunk, Hybrid and Link access
IEEE 802.1 Q-in-Q	Supports Double VLAN Tag function for implementing Metro Network topologies.
Private VLAN	The private VLAN supports isolated port access with the uplink port in the switch. Typically, each private VLAN contains many private ports and one given uplink port; each private port is isolated with each other and only communicates with the uplink port for the outgoing data and incoming data to provide client port isolated feature.
Class of Service	IEEE 802.1p class of service; per port 4 priority queues.
Traffic Prioritize	Supports 4 physical queues, weighted round robin queuing (WRR 8:4:2:1) and Strict Priority scheme, which follows 802.1p COS tag

and IPv4 ToS/ Diffserv information to prioritize the traffic of your industrial network.

IGMP Snooping	IGMP Snooping v1/v2 /v3 for multicast filtering and IGMP Query mode; also support unknown multicasting process forwarding policies- drop, flooding and forward to router port.
Rate Control	Ingress filtering for Broadcast, Multicast, Unknown DA or all packets. Egress filtering for all packet types.
Port Mirroring	Online traffic monitoring on multiple selected ports
Port Security	Port security to assign authorized MAC to specific port
DHCP	DHCP Client, DHCP Server with IP & MAC Address binding and DHCP agent (option 82).
IEEE 802.1x with Radius Server Authentication	Port based network access control and also supports user authenticate by the radius account, password and key for the radius server authentication.
Modbus TCP/IP	Support open protocol- modbus TCP/IP with function code group -4 for factory automation application.

Network Redundancy

Multiple Super Ring (MSR)[™]	New generation Korenix Ring Redundancy Technology, Includes Rapid Super Ring, Rapid Dual Homing, TrunkRing [™] , MultiRing [™] and backward compatible with legacy Super Ring [™] .
Rapid Dual Homing (RDH)[™]	Multiple uplink paths to one or multiple upper switch
TrunkRing[™]	Integrate port aggregate function in ring path to get higher throughput ring architecture
MultiRing[™]	Couple or multiple up to 16 Rapid Super Rings, JetNet 4508 V2 supports up to 4 Fast Ethernet Ring in one Switch.
IEEE802.1d Rapid Spanning Tree	IEEE802.1D-2004 Rapid Spanning Tree Protocol. Compatible with Legacy Spanning Tree and IEEE 802.1w
IEEE802.1s	Supports multiple RSTP deployed in a VLAN or multiple VLANs.
Multiple Spanning Tree	IEEE802.1s MSTP, each MSTP instance can include one or more VLANs.
ITU-T G.8032	50ms failure Recovery Time, 50ms Restoration Time

Interface

Enclosure Port	Fast Ethernet communication port: 6 x RJ-45 RS-232 console interface: RJ-45 connector 100Mbps Fiber interface: 2 x SC or ST (by request) DI/DO port: 4-pin removable terminal block Power port: 4-pin removable terminal block
-----------------------	--

Cables	10Base-T: 2-pairs UTP/STP Cat. 3, 4, 5 cable, EIA/TIA-568B 100-ohm (100m) 100 Base-TX: 2-pairs UTP/STP Cat. 5 cable, EIA/TIA-568B 100-ohm (100m) JetNet 4508if -m: multi-mode, 50~62.5/125um, 2KM JetNet 4508if -s: single mode, 8~10/125um, 30KM
Fiber port characteristics	JetNet 4508if -m Wavelength:1310nm Tx power: -20dBm ~ -10dBm Rx sensitivity: -32dBm ~ -3dBm Link Budget: 12dB JetNet 4508if -s Wavelength: 1310nm Tx power: -15dBm ~ -8 dBm Rx sensitivity: -34dBm ~ 0 dBm Link Budget:19dB
RS-232 serial interface	Supports Cisco like command line interface for out-band management

System Diagnostic LEDs

System	Power status (Green): On (power is on applying) Digital Input (Green): On (Digital signal is detected) Alarm Output (Red): On (Output conductor is formed as a close circuit) System (Green): On (the system is ready), Blinking (system is on firmware upgrade progress) Ring Status (Green/Yellow): Green on (Ring status is normal), Yellow on (Ring Fail is occurred)
Fast Ethernet port	Link (Green On) / Activity (Green Blinking)

Power Requirements

System Power	Isolated Redundant power input with polarity reverse protection Input Range: 10.8~32V DC System Type: Positive or Negative power source
Power Consumption	15Watts / DC 24V

Mechanical

Installation	DIN Rail Mounting or Wall Mounting
Case	Aluminum metal case with grade 31 protection
Dimension	55 (W) x 149 (H) x 131.2 (D) / with DIN Rail Clip 55 (W) x 149 (H) x 120.6 (D) / without DIN Rail Clip

Weight 0.885kg without package

Environmental

Operating Temperature -25~70°C (Jetnet 4508i), -40°C~75 °C (JetNet 4508i-w)
-10~70°C (JetNet 4508if), -40°C~75 °C (JetNet 4508if -w)

Operating Humidity 0% ~ 95%, non-condensing

Storage Temperature -40°C ~ 85 °C

Hi-Pot Insulation AC 1.5KV for all ports and power

Regulatory Approvals

EMC Compliance with Heavy Industrial standards- IEC 61000-6-2, IEC 61000-6-4; IEEE 61850-3 and IEEE 1613 Compliant

EMI

FCC Class A, CE/ EN55022

Radiation, Conduction

EMS

IEC 61000-4-2, IEC 61000-4-3, IEC 61000-4-4, IEC 61000-4-5, IEC 61000-4-6, IEC 61000-4-8, IEC 61000-4-9

Vibration & Shock IEC 60068-2-6/ IEC 60068-32

Free Fall IEC60068-2-32 with package

Warranty Global 5 years

5.3 Korenix Private MIB

Korenix provides many standard MIBs for users to configure or monitor the switch's configuration by SNMP. But, since some commands can't be found in standard MIB, Korenix provides Private MIB to meet up the need. Compile the private MIB file by your SNMP tool. You can then use it.

Private MIB tree is the same as the web tree. This is easier to understand and use. If you are not familiar with standard MIB, you can directly use private MIB to manage /monitor the switch, no need to learn or find where the OIDs of the commands are MIB can be found in product CD or downloaded from Korenix Web site with the latest version firmware release.

The path of the JetNet 4508f V2 is 1.3.6.1.4.1.24062.2.2.18 and JetNet 4508 V2 is 1.3.6.1.4.24062.2.2.17 as figures below.

Name:	jetnet4508fV2
Type:	OBJECT-IDENTIFIER
OID:	1.3.6.1.4.1.24062.2.2.18
Full path:	iso(1).org(3).dod(6).internet(1).private(4).enterprises(1).korenix(24062).products(2).managedFESwitch(2).jetnet4508fV2(18)
Module:	Jetnet4508fV2
Parent:	managedFESwitch
First child:	systemInfo
Prev sibling:	jetnet4508V2
Name:	jetnet4508V2
Type:	OBJECT-IDENTIFIER
OID:	1.3.6.1.4.1.24062.2.2.17
Full path:	iso(1).org(3).dod(6).internet(1).private(4).enterprises(1).korenix(24062).products(2).managedFESwitch(2).jetnet4508V2(17)
Module:	Jetnet4508V2
Parent:	managedFESwitch
First child:	systemInfo
Next sibling:	jetnet4508fV2

The JetNet 4508 / 4508f's private MIB supports various of MIB entries, which are system basic setting, port configuration, network redundancy, VLAN, traffic priority, multicasting, snmp, security, system warning, monitoring and configuration saving. User can monitoring and configures JetNet 4508 V2/JetNet 4508f V2 by SNMP MIB browser tools and through those MIB entries to achieve remote management.

The Private MIB includes 12 major entries for system configuration and monitoring as below listing:

System information: read only

Basic Setting MIB entry: read and write

Port Configuration MIB entry: Read and Write

Network redundancy MIB entry: Read and Write

Vlan MIB entry: Read and Write

Traffic prioritization MIB entry: Read and Write

Multicast Filtering MIB entry: Read and Write

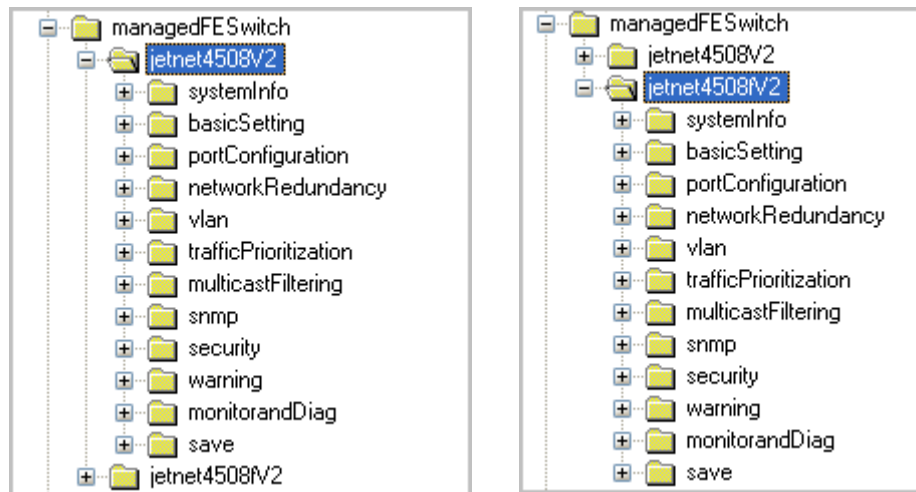

SNMP MIB entry: Read and write

Security MIB entry: Read and write

Warning MIB entry: Read and write

Monitor and Diag: Read and write

Save MIB entry: write only

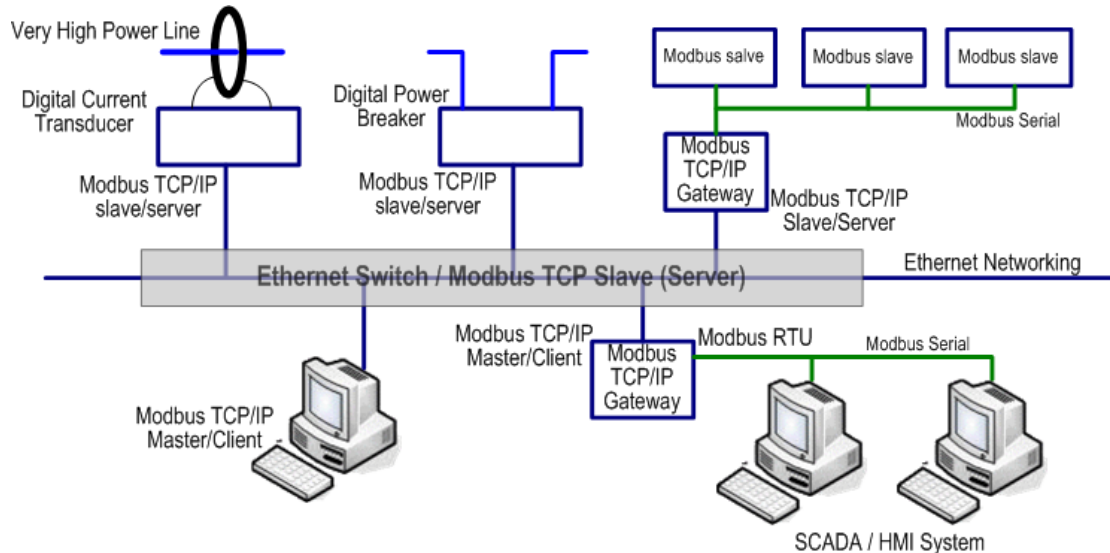

5.4 Modbus TCP protocol

The Modbus TCP is very similar to Modbus RTU, but transmits data within TCP/IP Data packets. It was developed in 1979 for industrial automatic communication system and has become a standard protocol for industrial communication for the transfer of discrete analog I/O devices or PLC systems. It defines a simple protocol data unit independent of the underlying data link layer. The Modbus TCP packet includes 3 parts - MBAP header, function code and data payload, the MBAP header is used on the TCP/IP header to identify the Modbus application Data Unit and provides some differences compared to the MODBUS RTU application data unit used on a serial line. The MBAP header also includes a unit identifier to recognize and communicate between multiple independent Modbus end units.

The Modbus devices communicate using a master (client) /slave (server) architecture, only one device can initiate a transaction and the others respond to the master/client. The other devices (slave/server) respond by supplying the requested data to the master/client, or by taking the action requested in the query. The slave/server can be any peripheral device (DSC unit, PLC unit,

Volt/Current Transducer, network communication switch) which process information and sends the output data to the master using modbus TCP protocol. Korenix JetNet Switch operating as slave/server devices, while a typical master/client device is host computer running appropriate application software, like as SCADA / HMI system. The transction architecture like as the drawing following.

There are three most common Modbus versions, Modbus ASCII, Modbus RTU and Modbus TCP. Ethernet based device, Industrial Ethernet Switch for example, supports Modbus TCP that it can be polled through Ethernet. Thus the Modbus TCP master can read or write the Modbus registers provided by the Industrial Ethernet Switch.

The JetNet Managed DIN-Rail Ethernet Switch has implement modbus/TCP register in the firmware. Those register mapping to some of Ethernet Switchs" operating information, includes decription, IP address, power status, interface status, interface information and inbound/outbound packet statistics. With the register supports, user can read the information through their own Modbus TCP based progress/ display/ monitor applications and monitor the status of the switch easily.

The configuration of Modbus/TCP only present in CLI management mode and the no extra user interface for Web configuration.

5.4.1 Modbus Function Code

The Modbus TCP device uses a subset of the standard Modbus TCP function code to access device-dependent information. Modbus TCP function code is defined as below.

FC	Name	Usage
----	------	-------

01	Read Coils	Read the state of a digital output
02	Read Input Status	Read the state of a digital input
03	Read Holding Register	Read holding register in 16-bits register format
04	Read Input Registers	Read data in 16-bits register format
05	Write Coil	Write data to force a digital output ON/OFF
06	Write Single Register	Write data in 16-bits register format
15	Force Multiple Coils	Write data to force multiple consecutive coils

The JetNet device supports the function code 04, which name is Read Input Registers. With this support, the remote SCADA or other Modbus TCP application can poll the information of the device and monitor the major status of the switch.

5.4.2 Error Checking

The utilization of the error checking will help eliminate errors caused by noise in the communication link. In Modbus TCP mode, messages include an error-checking field that is based on a Cyclical Redundancy Check (CRC) method. The CRC field checks the contents of the entire message. It applied regardless of any parity check method used for the individual BYTE octets of the message. The CRC value is calculated by the transmitting device, which appends the CRC to the message. The receiving device recalculates a CRC during receipt of the message, and compares the calculated value to the actual value it received in the CRC field.

5.4.3 Exception Response

If an error occurs, the slave sends an exception response message to master consisting of the slave address, function code, exception response code and error check field. In an exception response, the slave sets the high-order bit (MSB) of the response function code to one. The exception response codes are listed below.

Code	Name	Descriptions
01	Illegal Function	The message function received is not allowable action.
02	Illegal Data Address	The address referenced in the data field is not valid.

03	Illegal Data Value	The value referenced at the addressed device location is no within range.
04	Slave Device Failure	An unrecoverable error occurred while the slave was attempting to perform the requested action.
05	Acknowledge	The slave has accepted the request and processing it, but a long duration of time will be required to do so.
06	Slave Device Busy	The slave is engaged in processing a long-duration program command.
07	Negative Acknowledge	The slave cannot perform the program function received in the query.
08	Memory Parity Error	The slave attempted to read extended memory, but detected a parity error in the memory.

5.4.4 Modbus TCP register table

Word Address	Data Type	Description
System Information		
0x0000	16 words	Vender Name = "Korenix" Word 0 Hi byte = „K" Word 0 Lo byte = „o" Word 1 Hi byte = „r" Word 1 Lo byte = „e" Word 2 Hi byte = „n" Word 2 Lo byte = „I" Word 2 Hi byte = „x" Word 2 Lo byte = „0" (other words = 0)
0x0010	16 words	Product Name = "JetNet5828G" Word 0 Hi byte = „J" Word 0 Lo byte = „e" Word 1 Hi byte = „T" Word 1 Lo byte = „N" Word 2 Hi byte = „e" Word 2 Lo byte = „t" Word 3 Hi byte = „5" Word 3 Lo byte = „8" Word 4 Lo byte = „2" Word 4 Hi byte = „8"

		Word 5 Lo byte = „G“ Word 5 Hi byte = „\0“ (other words = 0)
0x0020	128 words	SNMP system name (string)
0x00A0	128 words	SNMP system location (string)
0x0120	128 words	SNMP system contact (string)
0x01A0	32 words	SNMP system OID (string)
0x01C0	2 words	System uptime (unsigned long)
0x01C2 to 0x01FF	60 words	Reserved address space
0x0200	2 words	hardware version
0x0202	2 words	S/N information
0x0204	2 words	CPLD version
0x0206	2 words	Boot loader version
0x0208	2 words	Firmware Version Word 0 Hi byte = major Word 0 Lo byte = minor Word 1 Hi byte = reserved Word 1 Lo byte = reserved
0x020A	2 words	Firmware Release Date Firmware was released on 2010-08-11 at 09 o'clock Word 0 = 0x0B09 Word 1 = 0x0A08
0x020C	3 words	Ethernet MAC Address Ex: MAC = 01-02-03-04-05-06 Word 0 Hi byte = 0x01 Word 0 Lo byte = 0x02 Word 1 Hi byte = 0x03 Word 1 Lo byte = 0x04 Word 2 Hi byte = 0x05 Word 2 Lo byte = 0x06
0x020F to 0x2FF	241 words	Reserved address space
0x0300	2 words	IP address Ex: IP = 192.168.10.1 Word 0 Hi byte = 0xC0 Word 0 Lo byte = 0xA8 Word 1 Hi byte = 0x0A Word 1 Lo byte = 0x01

0x0302	2 words	Subnet Mask
0x0304	2 words	Default Gateway
0x0306	2 words	DNS Server
0x0308 to 0x3FF	248 words	Reserved address space (IPv6 or others)
0x0400	1 word	AC1 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0401	1 word	AC2 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0402	1 word	DC1 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0403	1 word	DC2 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0404 to 0x040F	12 words	Reserved address space
0x0410	1 word	DI1 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0411	1 word	DI2 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0412	1 word	DO1 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0413	1 word	DO2 0x0000:Off 0x0001:On 0xFFFF: unavailable
0x0414 to 0x041F	12 words	Reserved address space

0x0420	1 word	RDY 0x0000:Off 0x0001:On
0x0421	1 word	RM/RS (Green light) 0x0000:Off 0x0001:On
0x0422	1 word	RF/RS - (Yellow light) 0x0000:Off 0x0001:On

Port Information (32 Ports)		
0x1000 to 0x11FF	16 words	Port Description
0x1200 to 0x121F	1 word	Administrative Status 0x0000: disable 0x0001: enable
0x1220 to 0x123F	1 word	Operating Status 0x0000: disable 0x0001: enable 0xFFFF: unavailable
0x1240 to 0x125F	1 word	Duplex 0x0000: half 0x0001: full 0x0003: auto (half) 0x0004: auto (full) 0x0005: auto 0xFFFF: unavailable
0x1260 to 0x127F	1 word	Speed 0x0001: 10 0x0002: 100 0x0003: 1000 0x0004: 2500 0x0005: 10000 0x0101: auto 10 0x0102: auto 100 0x0103: auto 1000 0x0104: auto 2500 0x0105: auto 10000

		0x0100: auto 0xFFFF: unavailable
0x1280 to 0x129F	1 word	Flow Control 0x0000: off 0x0001: on 0xFFFF: unavailable
0x12A0 to 0x12BF	1 word	Default Port VLAN ID 0x0001-0xFFFF
0x12C0 to 0x12DF	1 word	Ingress Filtering 0x0000: disable 0x0001: enable
0x12E0 to 0x12FF	1 word	Acceptable Frame Type 0x0000: all 0x0001: tagged frame only
0x1300 to 0x131F	1 word	Port Security 0x0000: disable 0x0001: enable
0x1320 to 0x133F	1 word	Auto Negotiation 0x0000: disable 0x0001: enable 0xFFFF: unavailable
0x1340 to 0x135F	1 word	Loopback Mode 0x0000: none 0x0001: MAC 0x0002: PHY 0xFFFF: unavailable
0x1360 to 0x137F	1 word	STP Status 0x0000: disabled 0x0001: blocking 0x0002: listening 0x0003: learning 0x0004: forwarding
0x1380 to 0x139F	1 word	Default CoS Value for untagged packets
0x13A0 to 0x13BF	1 word	MDIX 0x0000: disable 0x0001: enable 0x0002: auto

		0xFFFF: unavailable
0x13C0 to 0x13DF	1 word	Medium mode 0x0000: copper 0x0001: fiber 0x0002: none 0xFFFF: unavailable
0x13E0 to 0x14FF	288 words	Reserved address space
SFP Information (32 Ports)		
0x1500 to 0x151F	1 word	SFP Type
0x1520 to 0x153F	1 words	Wave length
0x1540 to 0x157F	2 words	Distance
0x1580 to 0x167F	8 words	Vender
0x1680 to 0x17FF	384 words	Reserved address space
SFP DDM Information (32 Ports)		
0x1800 to 0x181F	1 words	Temperature
0x1820 to 0x185F	2 words	Alarm Temperature
0x1860 to 0x187F	1 words	Tx power
0x1880 to 0x18BF	2 words	Warning Tx power
0x18C0 to 0x18DF	1 words	Rx power
0x18E0 to 0x191F	2 words	Warning Rx power
0x1920 to 0x1FFF	1760 words	Reserved address space
Inbound packet information		
0x2000 to 0x203F	2 words	Good Octets
0x2040 to 0x207F	2 words	Bad Octets
0x2080 to 0x20BF	2 words	Unicast
0x20C0 to 0x20FF	2 words	Broadcast
0x2100 to 0x213F	2 words	Multicast
0x2140 to 0x217F	2 words	Pause
0x2180 to 0x21BF	2 words	Undersize

0x21C0 to 0x21FF	2 words	Fragments
0x2200 to 0x223F	2 words	Oversize
0x2240 to 0x227F	2 words	Jabbers
0x2280 to 0x22BF	2 words	Disacrcds
0x22C0 to 0x22FF	2 words	Filtered frames
0x2300 to 0x233F	2 words	RxError
0x2340 to 0x237F	2 words	FCSError
0x2380 to 0x23BF	2 words	Collisions
0x23C0 to 0x23FF	2 words	Dropped Frames
0x2400 to 0x243F	2 words	Last Activated SysUpTime
0x2440 to 0x24FF	191 words	Reserved address space
Outbound packet information		
0x2500 to 0x253F	2 words	Good Octets
0x2540 to 0x257F	2 words	Unicast
0x2580 to 0x25BF	2 words	Broadcast
0x25C0 to 0x25FF	2 words	Multicast
0x2600 to 0x263F	2 words	Pause
0x2640 to 0x267F	2 words	Deferred
0x2680 to 0x26BF	2 words	Collisions
0x26C0 to 0x26FF	2 words	SingleCollision
0x2700 to 0x273F	2 words	MultipleCollision

0x2740 to 0x277F	2 words	ExcessiveCollision
0x2780 to 0x27BF	2 words	LateCollision
0x27C0 to 0x27FF	2 words	Filtered
0x2800 to 0x283F	2 words	FCSError
0x2840 to 0x29FF	447 words	Reserved address space
Number of frames received and transmitted with a length(in octets)		
0x2A00 to 0x2A3F	2 words	64
0x2A40 to 0x2A7F	2 words	65 to 127
0x2A80 to 0x2ABF	2 words	128 to 255
0x2AC0 to 0x2AFF	2 words	256 to 511
0x2B00 to 0x2B3F	2 words	512 to 1023
0x2B40 to 0x2B7F	2 words	1024 to maximum size

Note: the modbus TCP client will return 0xFFFF to modbus master when pulling reserved address.

5.4.5 CLI commands for Modbus TCP

The commands of Modbus TCP are listed as following table.

Feature	Command & example
Enable Modbus TCP	Switch(config)# modbus enable
Disable Modbus TCP	Switch(config)# modbus disable
Set Modbus interval time between request	Switch(config)# modbus idle-timeout <200-10000> Timeout vlaue: 200-10000ms Switch(config)# modbus idle-timeout 200 → set interval request time out duration to 200ms.
Set modbus TCP master communicate session.	Switch(config)# modbus master <1-20> Max Modbus TCP Master Switch(config)# modbus master 2 → set maximum

	modbus master up to 2; maximum support up to 20 modbus communicate sessions.
Set modbus TCP listening port	Switch(config)# modbus port port Listening Port Switch(config)# modbus port 502 ; default modbus TCP service port is 502.

5.5 Revision History

Edition	Date	Modifications
V01	12-Nov,2010	New editing
V02	1-DEC,2010	Change power wiring diagram.
V03	8-DEC,2010	Modify: <ol style="list-style-type: none"> 1. RS LED description 2. Add explanation for the feature diagram of JN 5010G. 3. update exactly model name 4. Change the power wiring diagram with 10V dc input.
V04	20-DEC,2010	Change RJ-45 /DB-9 Console cable connector Pin assignment.
V1.0	23-Mar-2011	Modify: <ol style="list-style-type: none"> 1. Add port description for port 7, 8 in the feature. 2. Add limitation for JetNet 4508 V2: port 7, 8 support 100Mbps Auto-Negotiation only in chapter 4.3.1 Port Control , page 51.
V1.1	22-Aug,2011	Add new features: <ol style="list-style-type: none"> 1. V1.1 firmware supports multi-language function for Web User Interface. (English, simplified Chinese) 2. MSTP (multiple Spanning Tree) IEEE 802.1s 3. Private VLAN, IEEE 802.1Q double tag VLAN 4. Add ModBus TCP register table 5. Add ModBus TCP CLI commands ModBus Dis/Enable, Modbus idle timeout, number of master, Modbus TCP service port. 6. Change Daylight Saving setting method to week and monthly basis. 7. Add Verification of Conformity cover for EN50121-4.
V1.11	11-OCT-2011	Add new cli command: Daylight saving time.
V1.12	29-Nov,2011	Add multiple alarm relay function. Add more Modbus TCP information: Function code, modbus introduction, etc.
V1.13	13,May,2012	Modify the descriptin of mutiple Event relay.
V1.14	23,Jun,2015	Integrated with JetNet 4508i series
V1.2	17, Apr,2017	Modify JetNet 4508i/if Power Range to 12-36V
V1.21	23, Nov,2017	Modify Modbus table

5.6 About Korenix

Less Time At Work! Fewer Budget on applications!

The Korenix business idea is to let you spend less time at work and fewer budget on your applications. Do you really want to go through all the troubles but still end up with low quality products and lousy services? Definitely not! This is why you need Korenix. Korenix offers complete product selection that fulfills all your needs for applications. We provide easier, faster, tailor-made services, and more reliable solutions. In Korenix, there is no need to compromise. Korenix takes care of everything for you!

Fusion of Outstandings

You can end your searching here. Korenix Technology is your one-stop supply center for industrial communications and networking products. Korenix Technology is established by a group of professionals with more than 10 year experience in the arenas of industrial control, data communications and industrial networking applications. Korenix Technology is well-positioned to fulfill your needs and demands by providing a great variety of tailor-made products and services. Korenix's industrial-grade products also come with quality services. No more searching, and no more worries. Korenix Technology stands by you all the way through.

Core Strength---Competitive Price and Quality

With our work experience and in-depth know-how of industrial communications and networking, Korenix Technology is able to combine Asia's research / development ability with competitive production cost and with quality service and support.

Global Sales Strategy

Korenix's global sales strategy focuses on establishing and developing trustworthy relationships with value added distributors and channel partners, and assisting OEM distributors to promote their own brands. Korenix supplies products to match local market requirements of design, quality, sales, marketing and customer services, allowing Korenix and distributors to create and enjoy profits together.

Quality Services

KoreCARE--- KoreCARE is Korenix Technology's global service center, where our professional staffs are ready to solve your problems at any time and in real-time. All of Korenix's products have passed ISO-9000/EMI/CE/FCC/UL certifications, fully satisfying your demands for product quality under critical industrial environments. Korenix global service center's e-mail is koreCARE@korenix.com

5 Years Warranty

Each of Korenix's product line is designed, produced, and tested with high industrial standard. Korenix warrants that the Product(s) shall be free from defects in materials and workmanship for a period of five (5) years from the date of delivery provided that the Product was properly installed and used. This warranty is voided if defects, malfunctions or failures of the warranted Product are caused by damage resulting from force measure (such as floods, fire, etc.), environmental and atmospheric disturbances, other external forces such as power line disturbances, host computer malfunction, plugging the board in under power, or incorrect cabling; or the warranted Product is misused, abused, or operated, altered and repaired in an unauthorized or improper way
